## Recommissioning of Linac2/PSB/ISOLDE from CCC

*Thursday 19 January 2006 08:55 (30 minutes)*

In 2006, the Linac2, PS Booster and ISOLDE facilities will be re-started from the CCC. While these machines have been running in 2005, and no major hardware changes are planned for the 2005/2006 shutdown, the main challenge will be the full remote operation without the possibility of quick local interventions by the operator. As for the Linac2 and PSB, work has been done to identify and upgrade equipment that is not compatible with this way of running. Concerning the ISOLDE facility, operation will be similar to previous years relying very much on local interventions and direct contact to the users. The main changes of operation from the CCC will be highlighted and a tentative planning for the start-up will be presented.

**Presenter:** HANKE, Klaus

**Session Classification:** Session 3: Start-up with Beam (from the CCC)
