ORAL PRESENTATION - Local Fields at Nonmagnetic Probe Sites in a Perovskite $\text{La}_{0.7}\text{Ca}_{0.3}\text{MnO}_3$

Tuesday, 18 September 2012 13:10 (15 minutes)

Perovskite manganese oxides (AMnO_3) are known to exhibit the effect of colossal magnetoresistance (CMR), a phenomenon that electrical resistivity undergoes a drastic change as large as five to six orders of magnitude by an applied magnetic field. Because of this unique physical property, much attention has been given to these oxides aiming at wide industrial applications. In order to realize practical use of these compounds, it is of importance to obtain information on local fields in the material as well as macroscopic quantities such as resistivity and magnetization.

From this point of view, we have applied the time-differential perturbed angular correlation (TDPAC) method to a study of a perovskite $\text{La}_{0.7}\text{Ca}_{0.3}\text{MnO}_3$, which exhibits the CMR effect by the paramagnetic-ferromagnetic phase transition ($T_c \sim 245$ K). In our previous work, we successfully observed drastic change in the local field at the probe nucleus, ^{140}Ce , between temperatures above and below T_c , which evidently suggests that the magnetic field produced by spins in Mn ions can be transferred to the probe at the A site. Since the ^{140}Ce probe arising from the disintegration of ^{140}La takes two possible oxidation states, $^{140}\text{Ce}^{3+}$ and $^{140}\text{Ce}^{4+}$, however, it remains unknown whether the observed magnetic field ($= 6.9(3)$ T at 240 K) is exclusively transferred from Mn spins or is produced in part by a 4f electron spin localized at the probe in the chemical state of $^{140}\text{Ce}^{3+}$. In the present work, therefore, we employed nonmagnetic $^{111}\text{Cd}(\leftarrow^{111}\text{mCd})$ and $^{111}\text{Cd}(\leftarrow^{111}\text{In})$ as the probe nuclei to shed light on the local field without self-owned spins. In the session, the effect of the 4f electron is discussed.

Primary author: Dr SATO, Wataru (Institute of Science and Engineering, Kanazawa University, Japan)

Co-authors: Dr OSA, Akihiko (Nuclear Science Research Institute, JAEA); Mr MINAMI, Daichi (Graduate School of Science and Technology, Kanazawa University); Ms KOMATSUDA, Sayaka (Graduate School of Science and Technology, Kanazawa University); Dr SATO, Tetsuya (Advanced Science Research Center, JAEA); Prof. OHKUBO, Yoshitaka (Research Reactor Institute, Kyoto University)

Presenter: Dr SATO, Wataru (Institute of Science and Engineering, Kanazawa University, Japan)

Session Classification: Session 4 - Reaction mechanisms and nuclear recoils, nuclear base spectroscopies, radiation geochronology, isotope effects

Track Classification: Reaction mechanisms and nuclear recoils, nuclear based spectroscopies (MOSSPEC and PAS), radiation geochronology, isotope effects
