

# Simulations of HL halo loss and IR losses

*R. Bruce, F. Cerutti, R. de Maria,  
A. Marsili, S. Redaelli*

# Outline

- Introduction: SixTrack
  - Halo / debris tracking
  - Trajectories
  - Results validation with measurements
- Halo: ATS results
  - Comparison with 7TeV nominal
- Debris tracking
  - Loss maps
  - TCL scan
- Conclusion

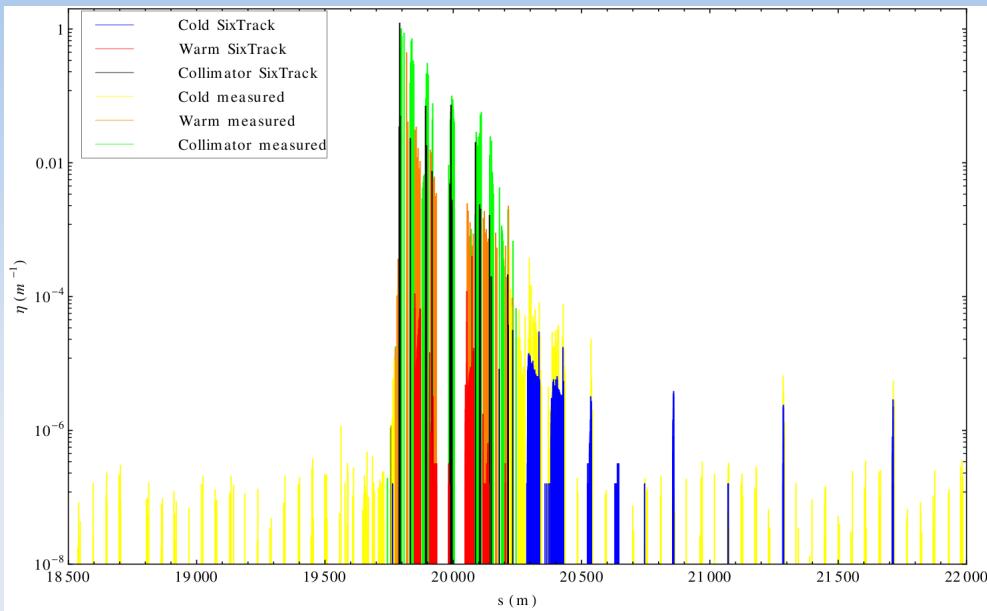

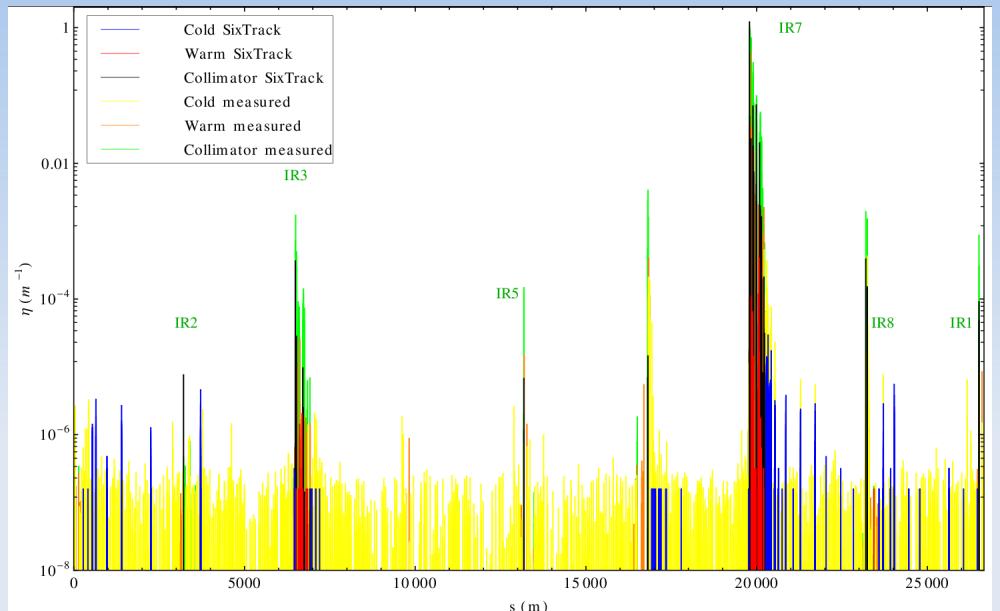

# Introduction: Simulation set-up

- Collimation version of SixTrack
  - Particles tracked around the ring
  - 6 dimensions:  $x, x', y, y', l, E$
  - Records scattering / absorption by collimators
- Post-processing: particles lost on aperture
- SixTrack was very successfully used for system design.  
Very good agreement with measured loss maps.
- Final energy deposition studies rely on complete simulations by FLUKA
- Good experimental basis: validated results
  - Comparison measurements / simulations

# LHC & IR7: comparison measurement / simulation

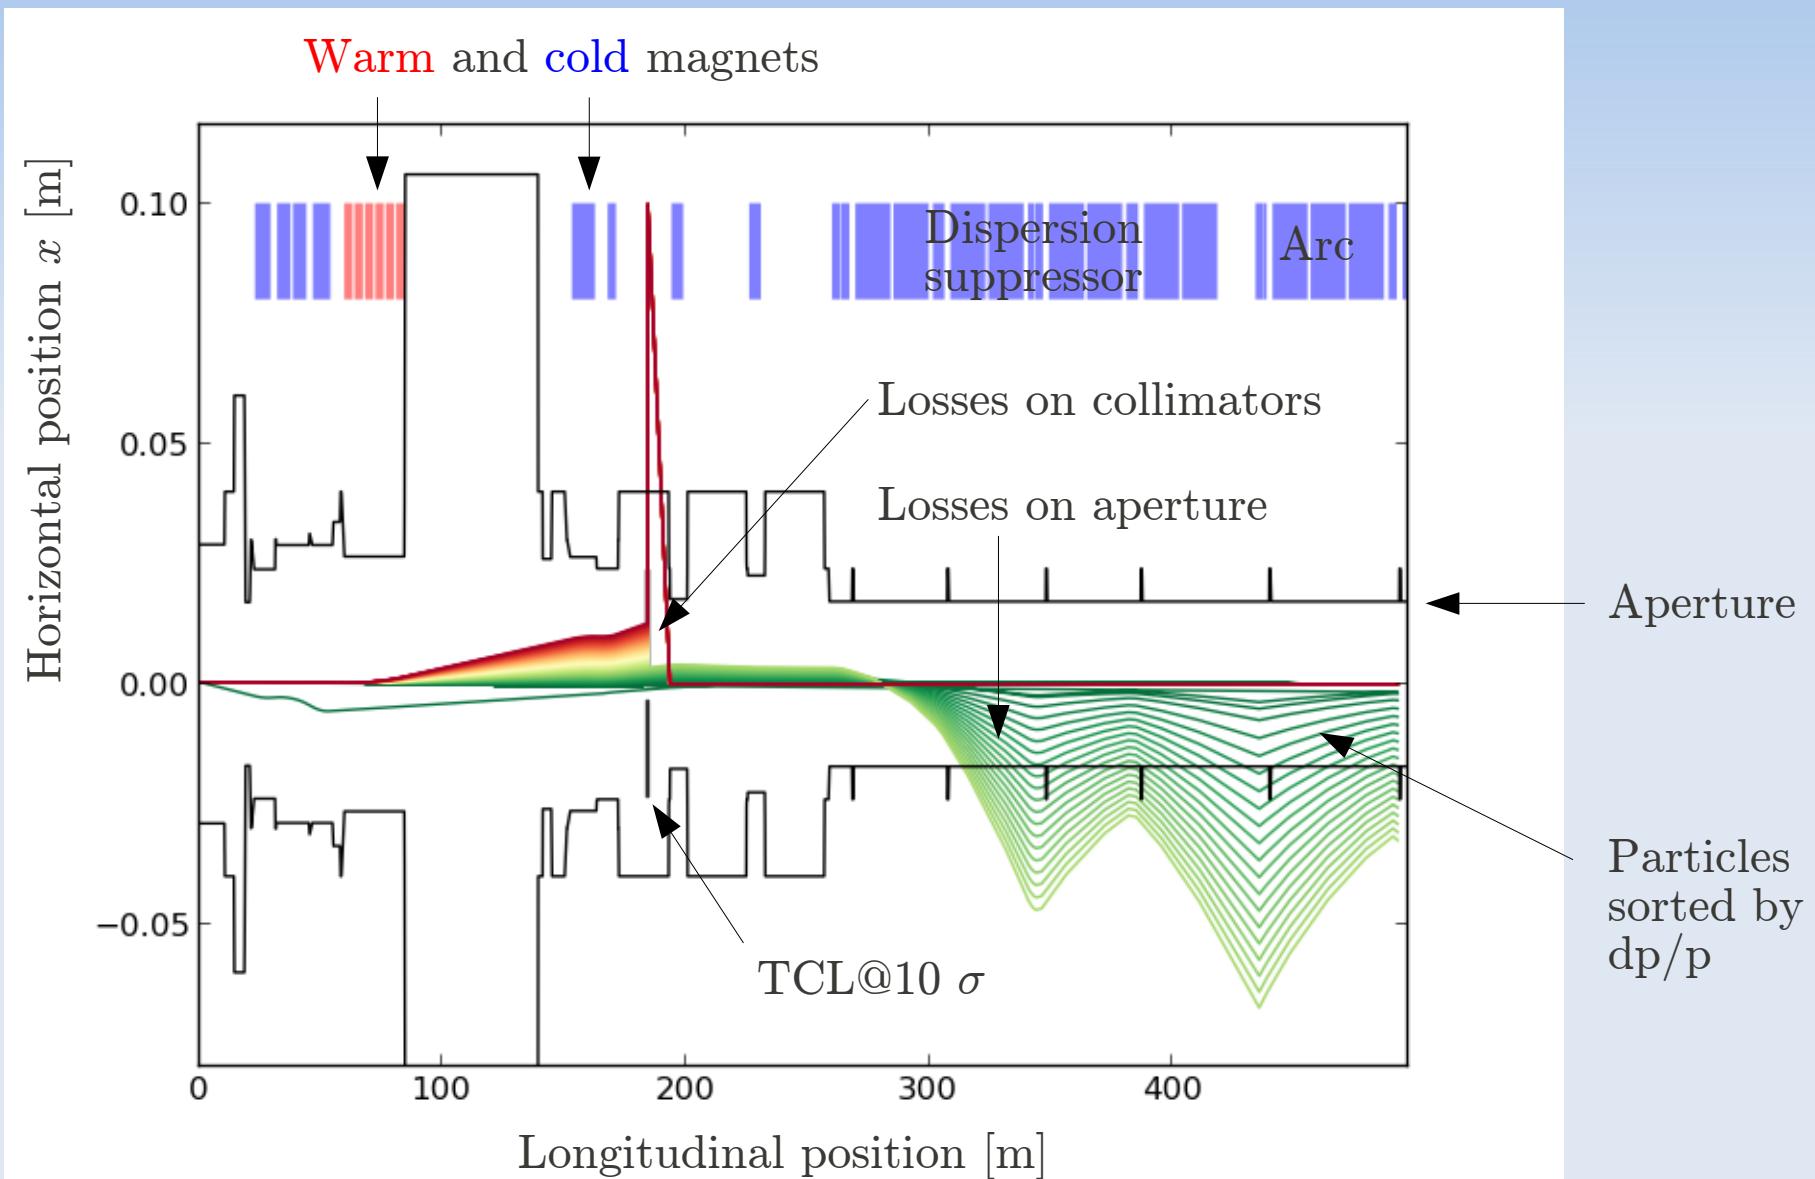

- Very good agreement in the arcs
- Losses at collimators underestimated (secondary showers?)

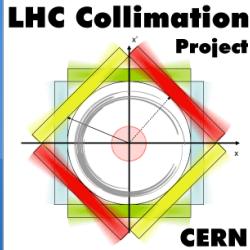

R. Bruce, CERN.

# Halo / debris

- **Halo loss simulations for collimation cleaning**
  - Principal assessment of collimation performance
  - Limitations in dedicated betatron and momentum cleaning insertion regions (IR3 and IR7)
  - IR loads from incoming beams (tertiary collimators)
  - Multiturn simulations
- **Debris loss simulation:** tracking debris from Interaction Points (IPs) around the ring
  - Tracking of protons that experience collision
  - Two effects: shift in momentum, extra kicks ( $x'$ ,  $y'$ )
  - Distributions simulated by the FLUKA team
  - Most particles lost immediately downstream of IP

# Particle tracking: “flat” $d\mathbf{p}/\mathbf{p}$ distribution

# ATS halo tracking

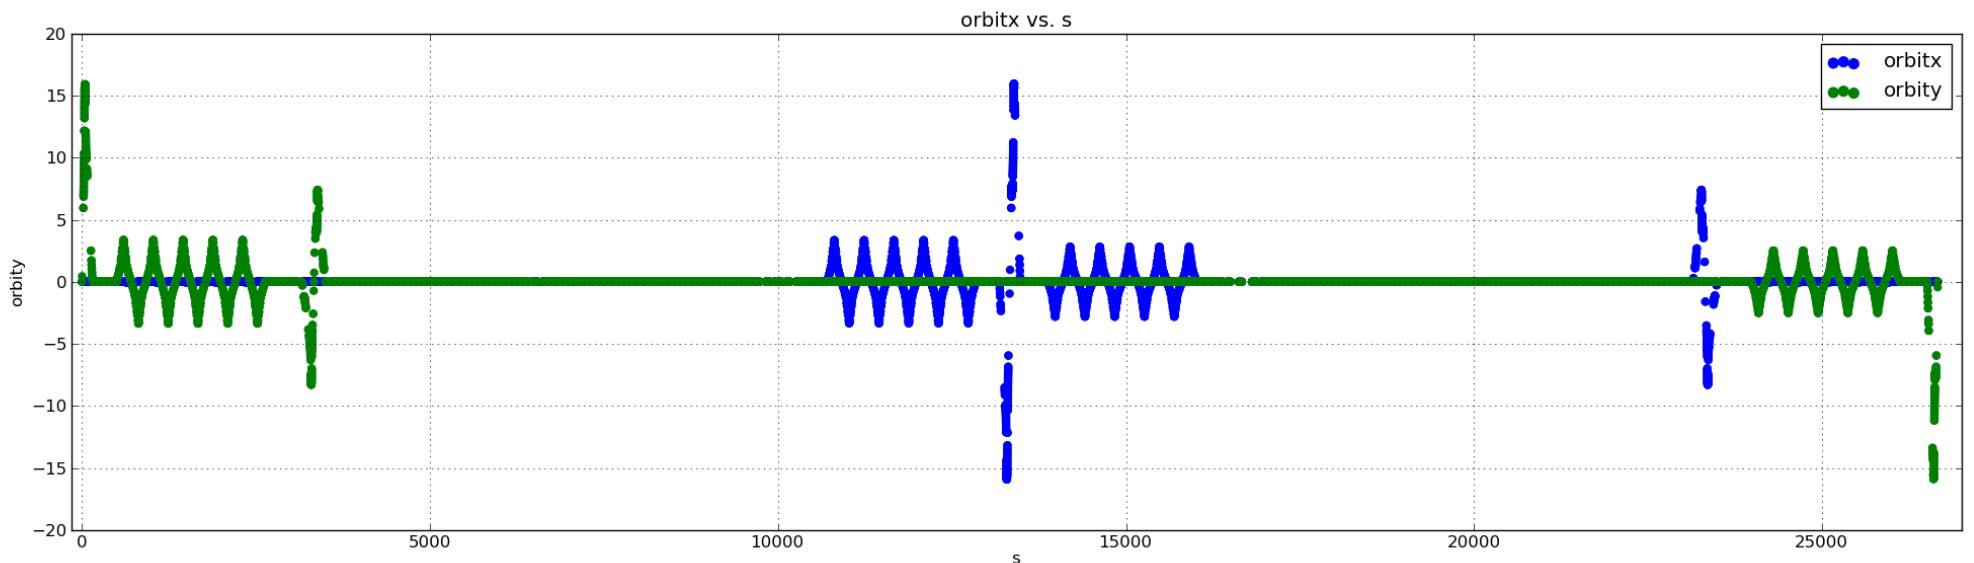

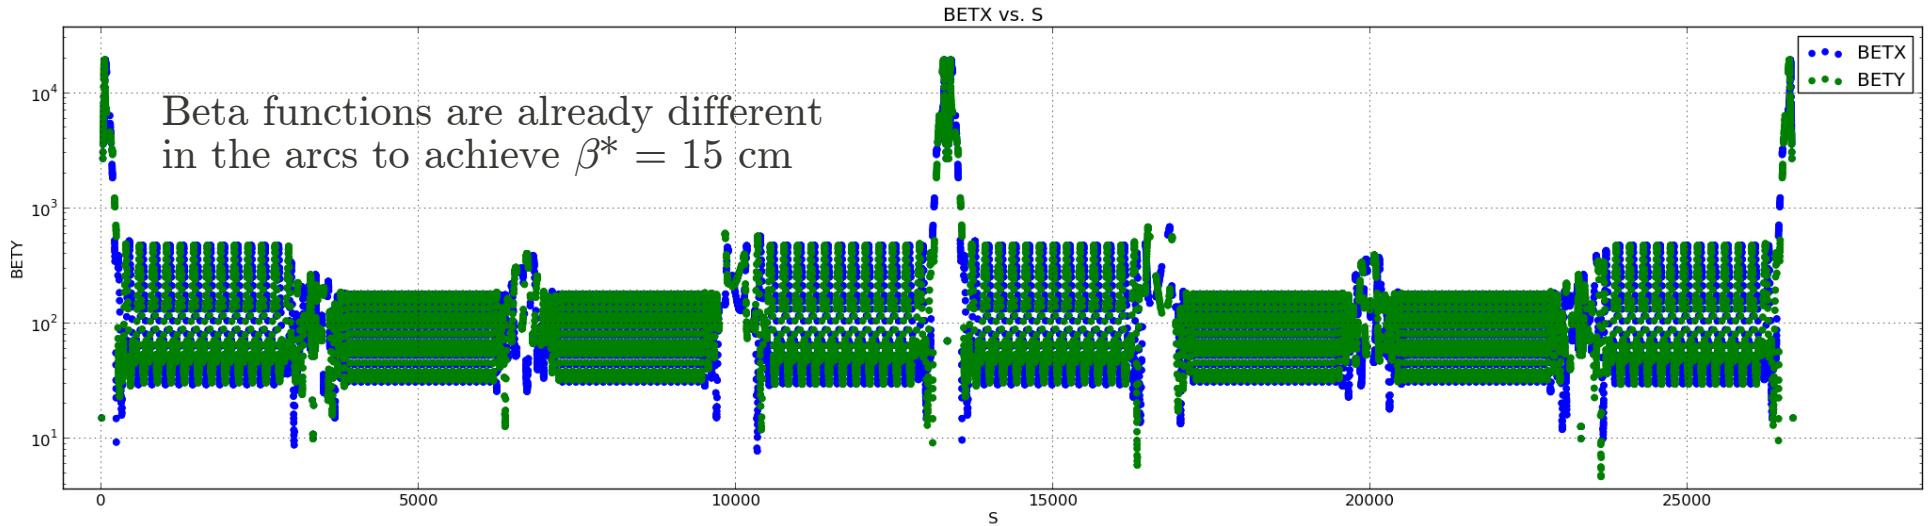

# First results for ATS optics

- ATS:  $\beta^* = 15$  cm
- Preliminary results:
  - Collimator hierarchy not fully decided
  - Preliminary aperture for post-processing
  - Work still in progress
- Used for first comparison with nominal case
- Debris: evaluate the (specific) need for protection in dispersion suppressors.

# ATS: Achromatic Telescopic Squeeze

# Collimator settings

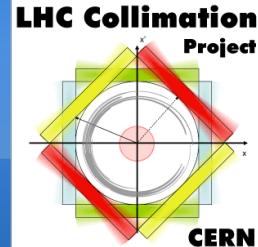

| Coll. setting | $\sigma$ |
|---------------|----------|
| TCP IR7       | 6.       |
| TCSG IR7      | 7.       |
| TCLA IR7      | 10.      |
| TCP IR3       | 12.      |
| TCSG IR3      | 15.6     |
| TCLA IR3      | 17.6     |

| Coll. setting | $\sigma$ |
|---------------|----------|
| TCLP          | 12.      |
| TCLI          | open     |
| TCSTCDQ IR6   | 7.5      |
| TCDQ IR6      | 8.       |
| TDI           | open     |
| TCT IR1/5/8   | 8.3      |
| TCT IR2       | 12.      |

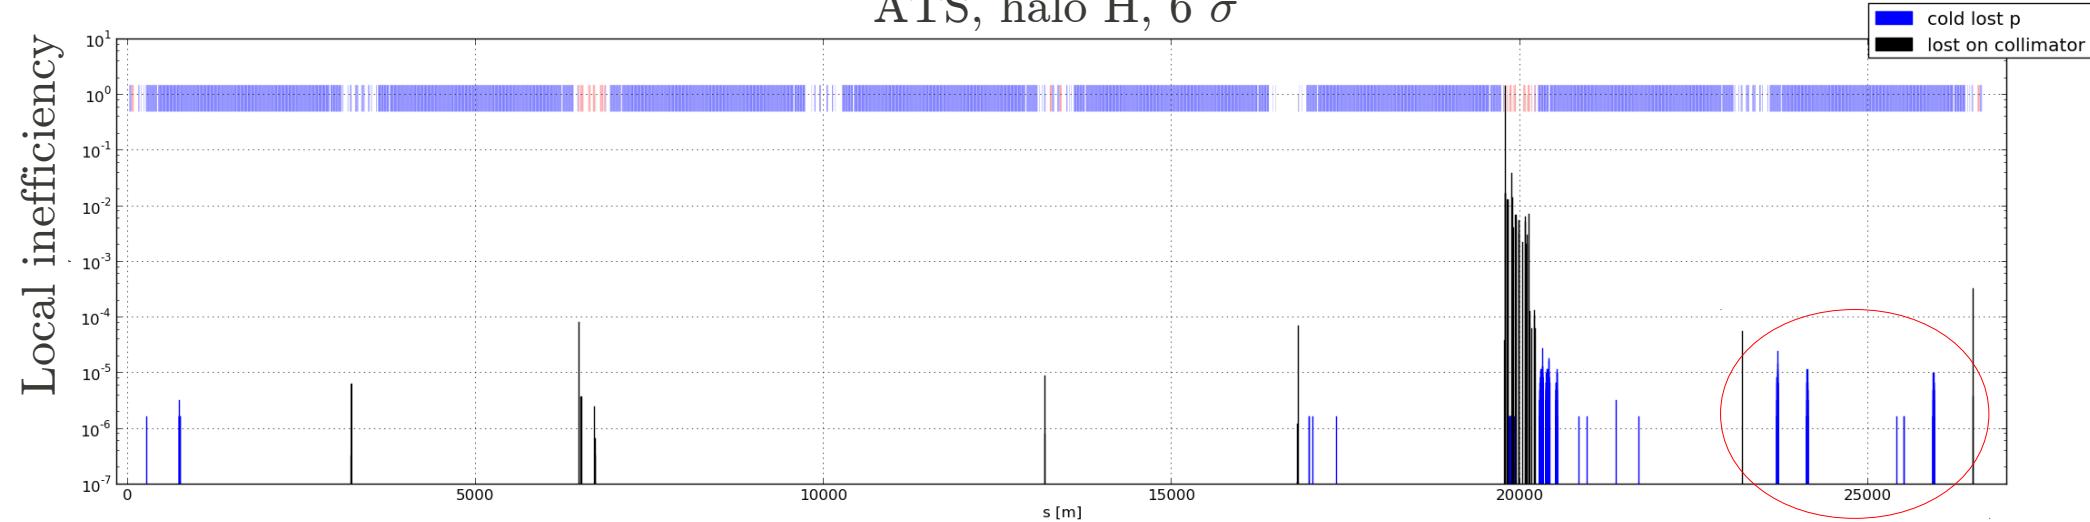

- Nominal settings at 7 TeV
- Note: TCT partially closed in IR2/8  
(to be reconsidered)

# Preliminary loss maps ATS / 7 TeV nominal

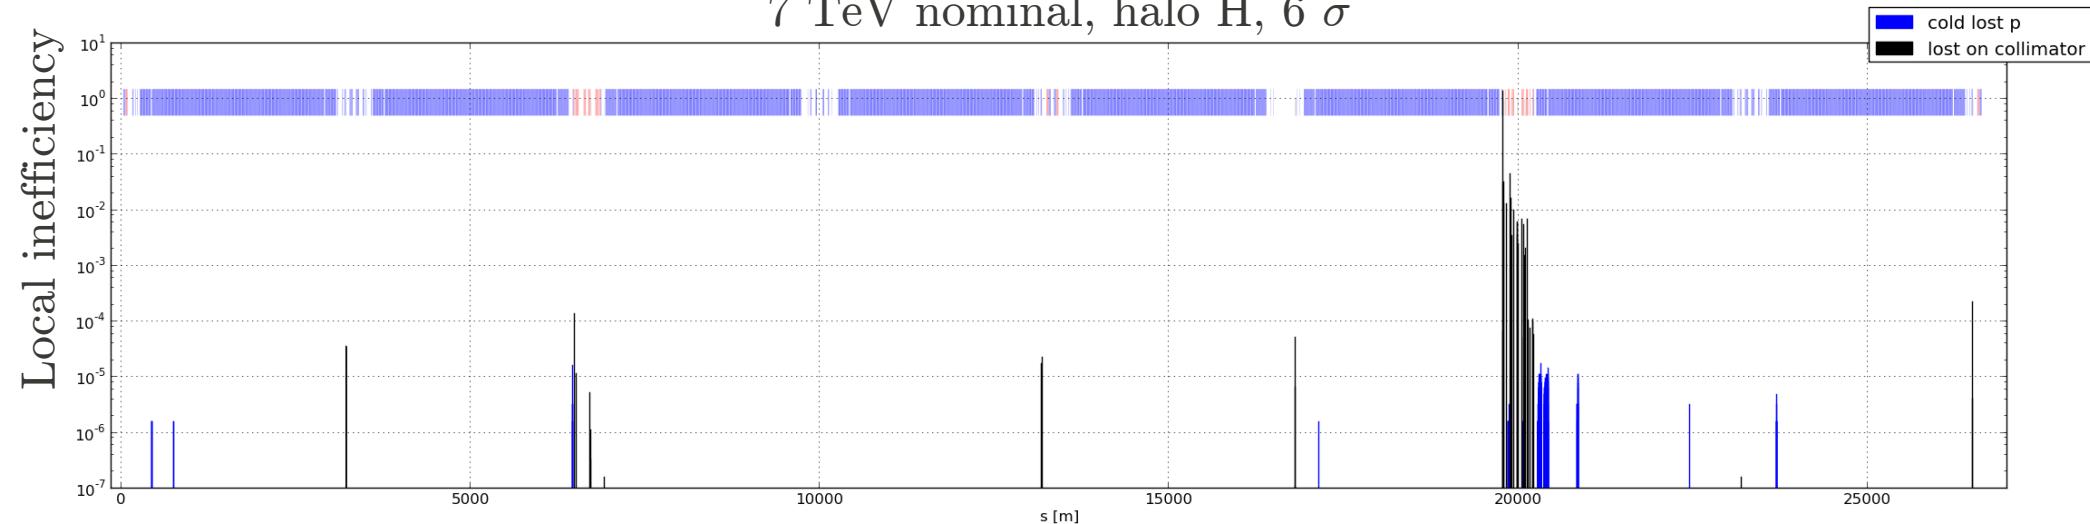

ATS, halo H,  $6\sigma$

Losses in arc 81 at the level of the losses  
in the dispersion suppressor right of IR7  
(detailed discussion tomorrow)

7 TeV nominal, halo H,  $6\sigma$

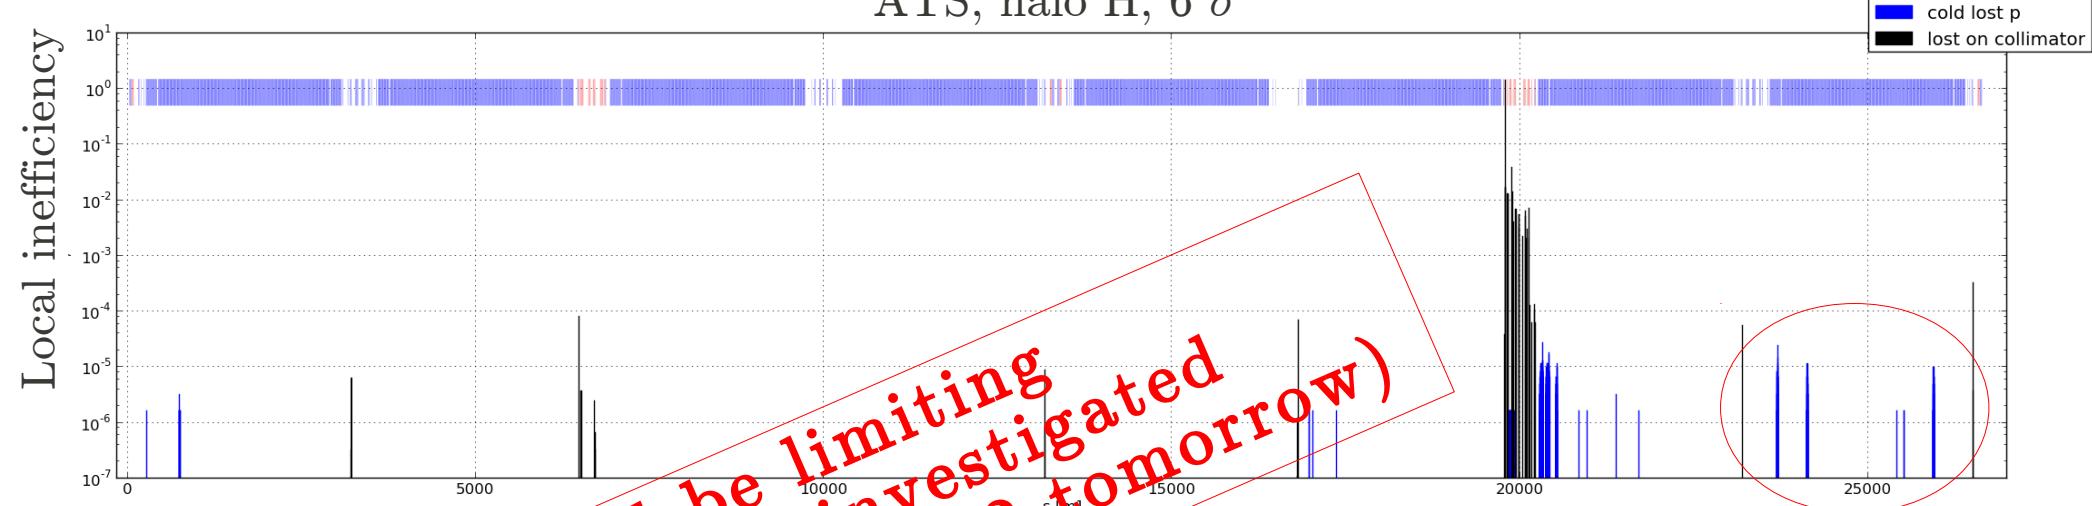

# Preliminary loss maps ATS / 7 TeV nominal

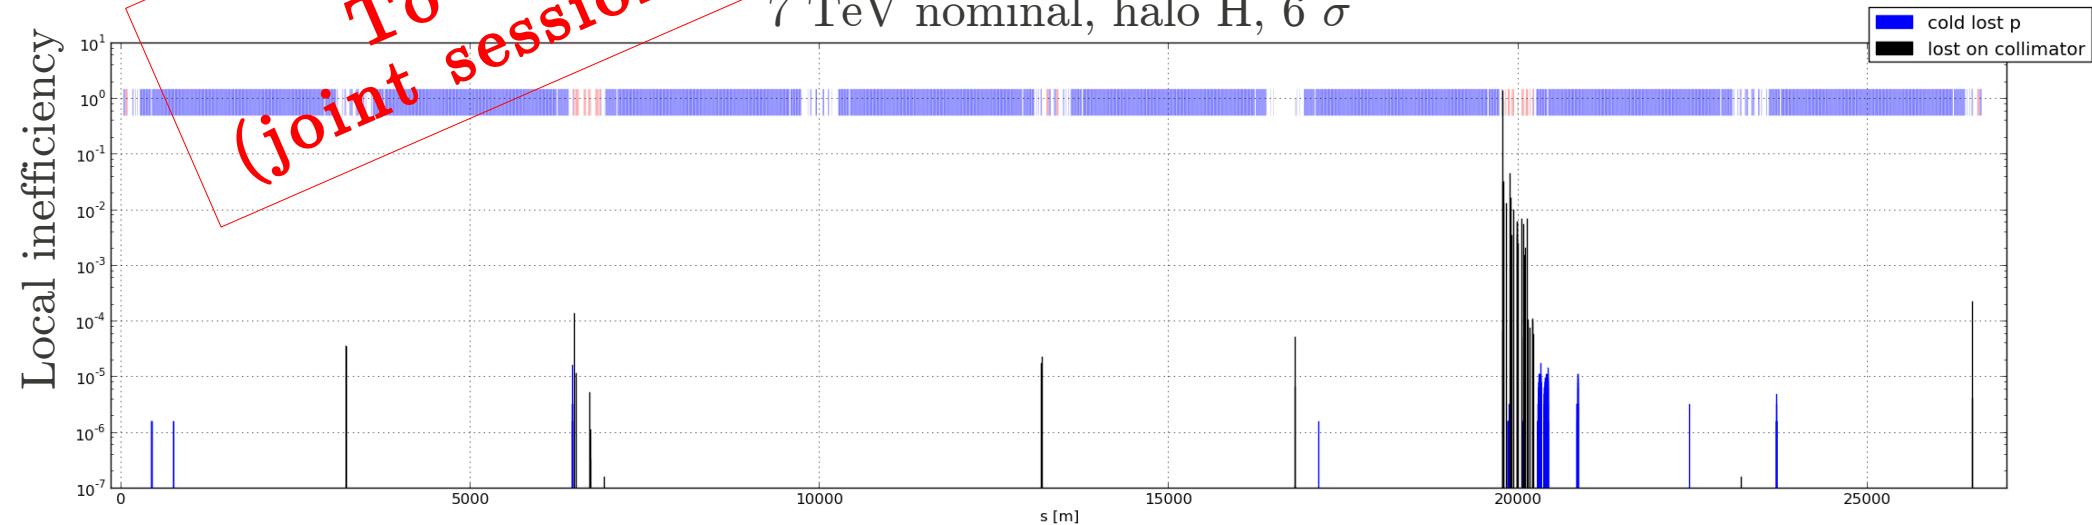

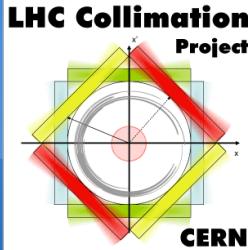

ATS, halo H,  $6\sigma$

Losses in arc 81 at the level of the losses in the dispersion suppressor right of IR7 (detailed discussion tomorrow)

7 TeV nominal, halo H,  $6\sigma$

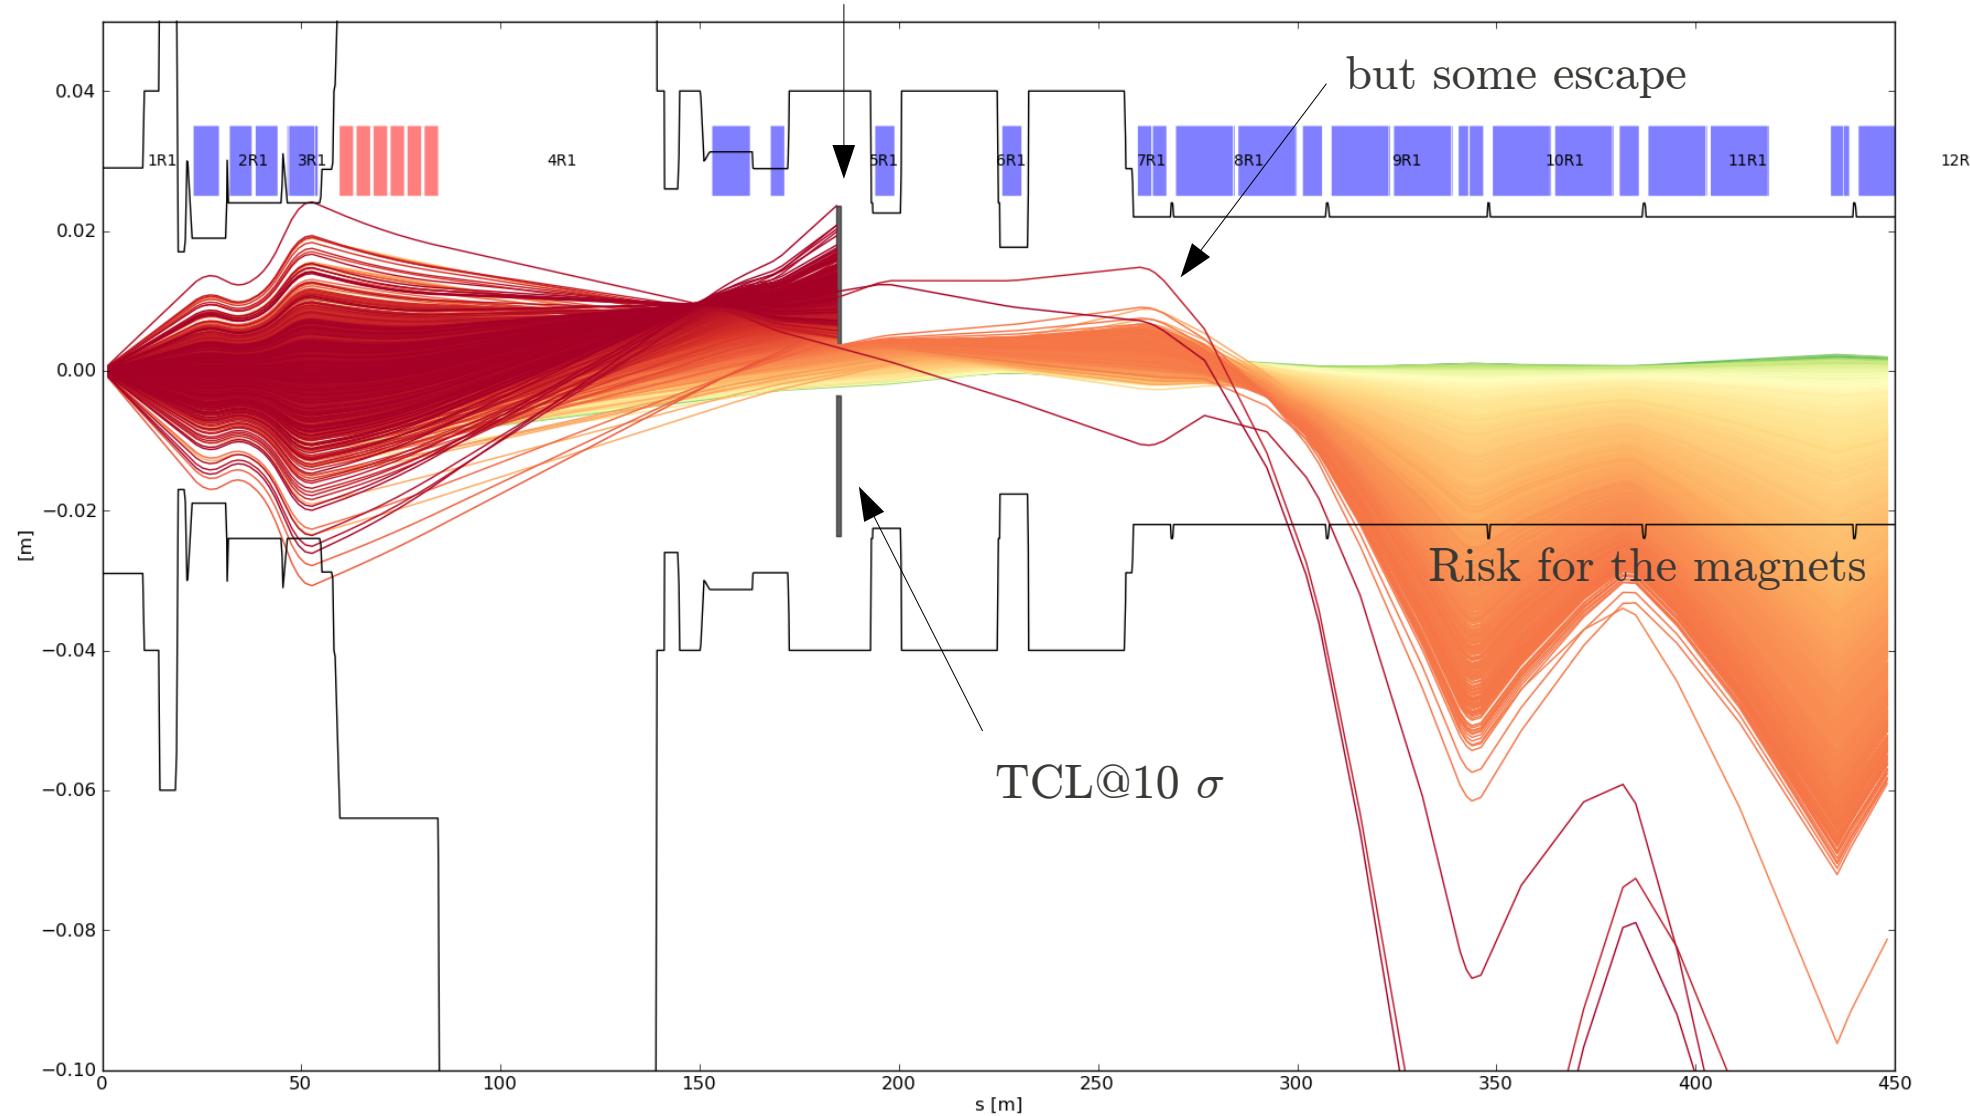

# Debris tracking

# 4TeV example: 6400 collisions first turn, sorted by dp/p

Protons of high  $dp/p$  are absorbed by the TCL

TCL@10  $\sigma$

Risk for the magnets

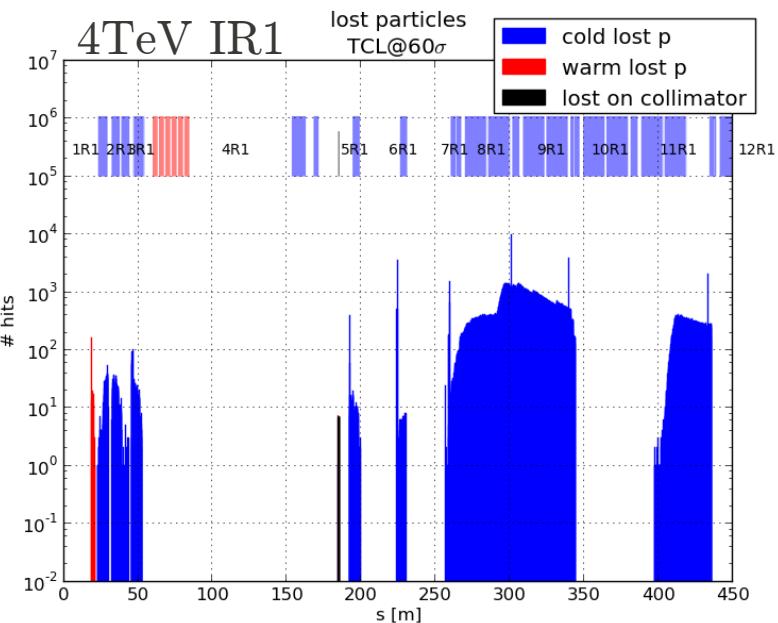

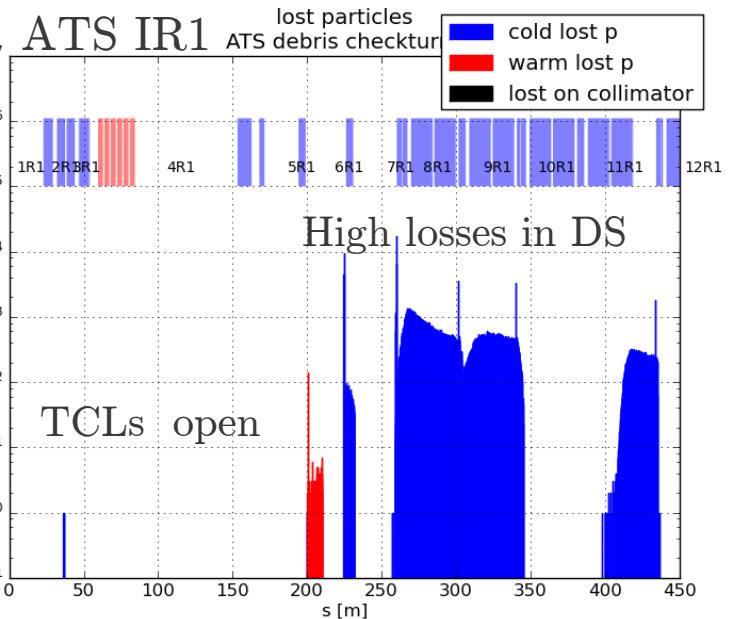

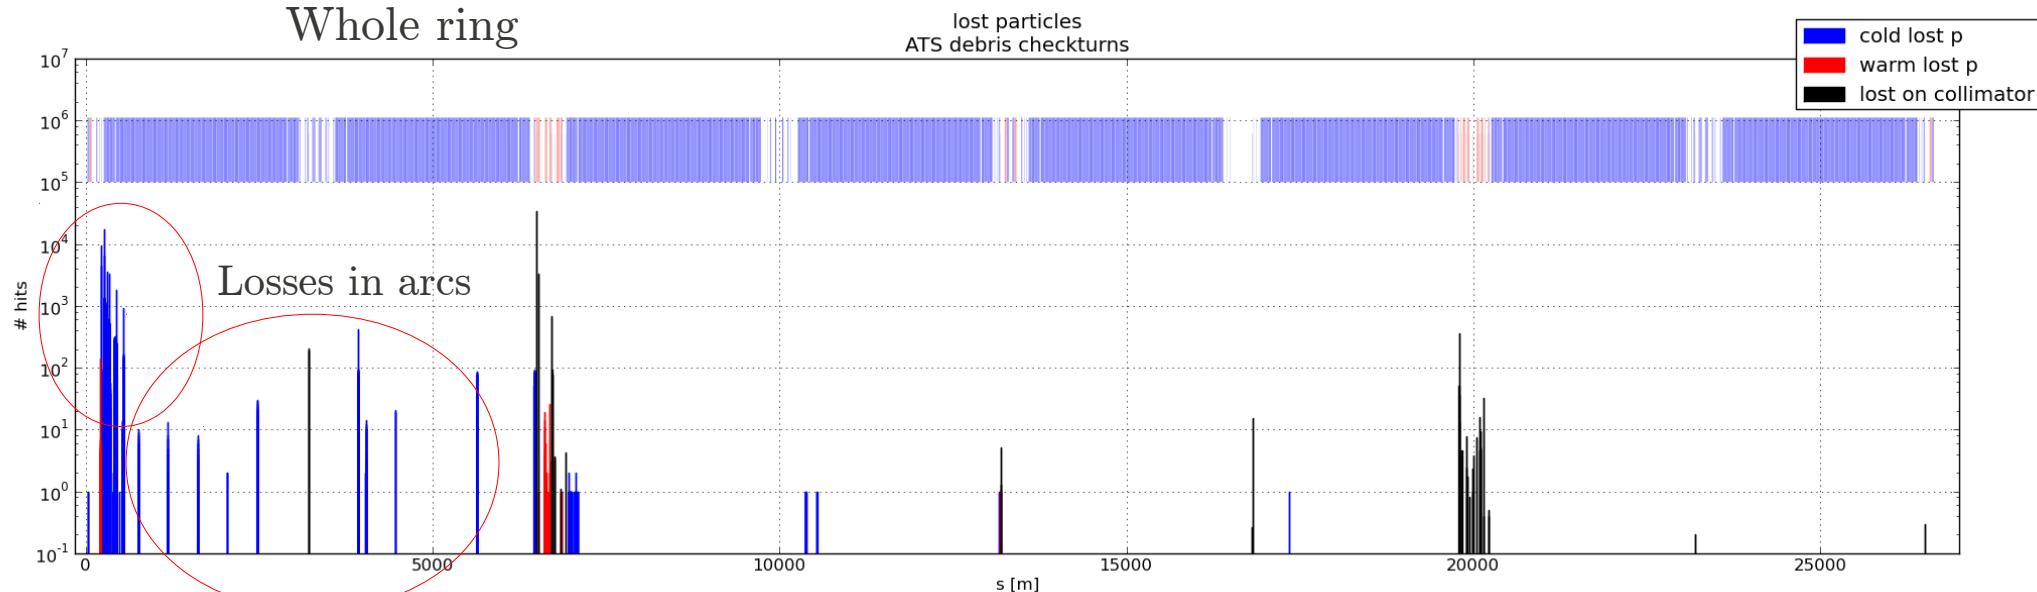

but some escape

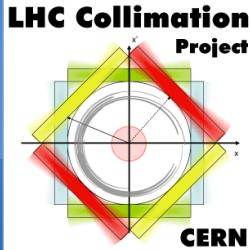

# Preliminary loss map ATS debris, 2 turns

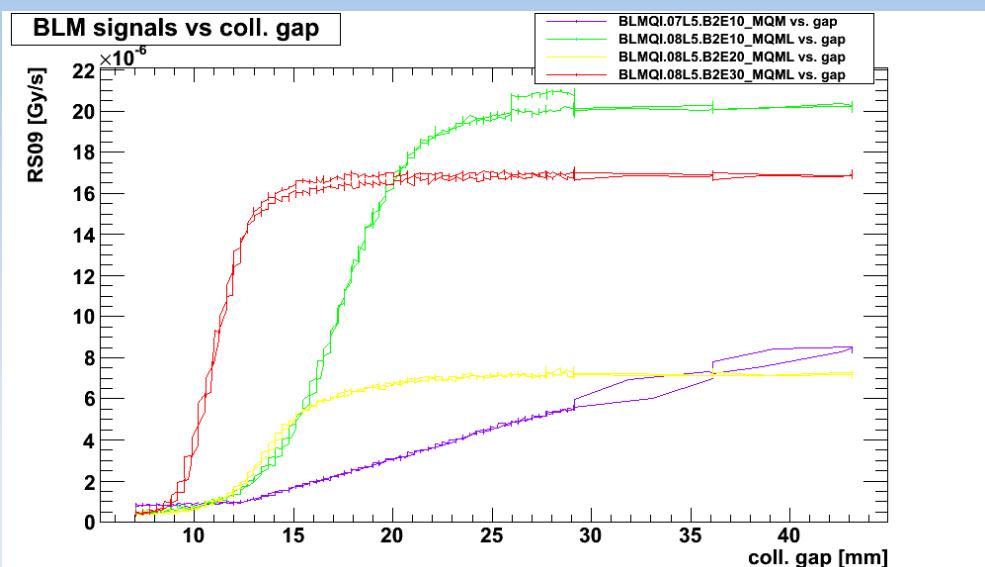

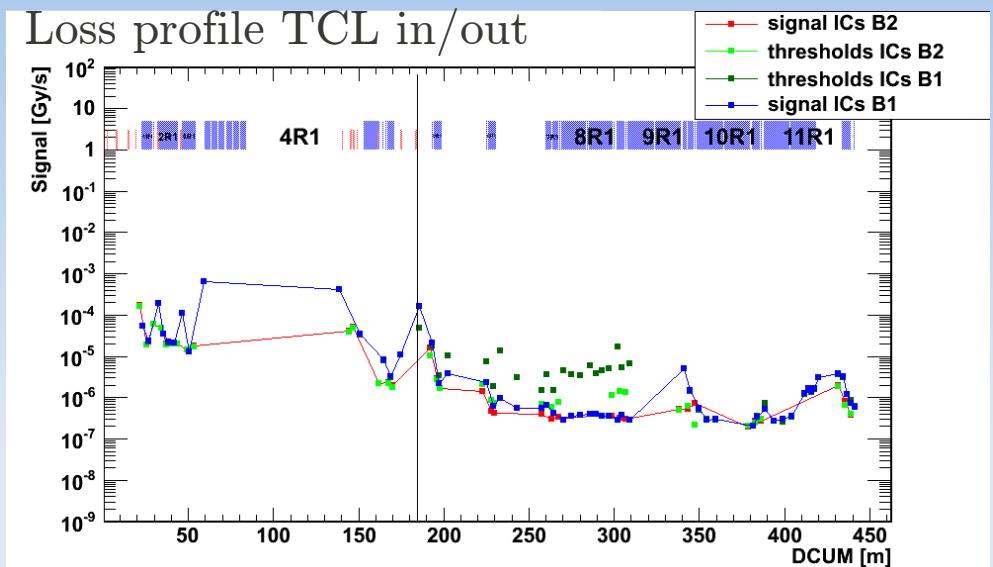

Whole ring

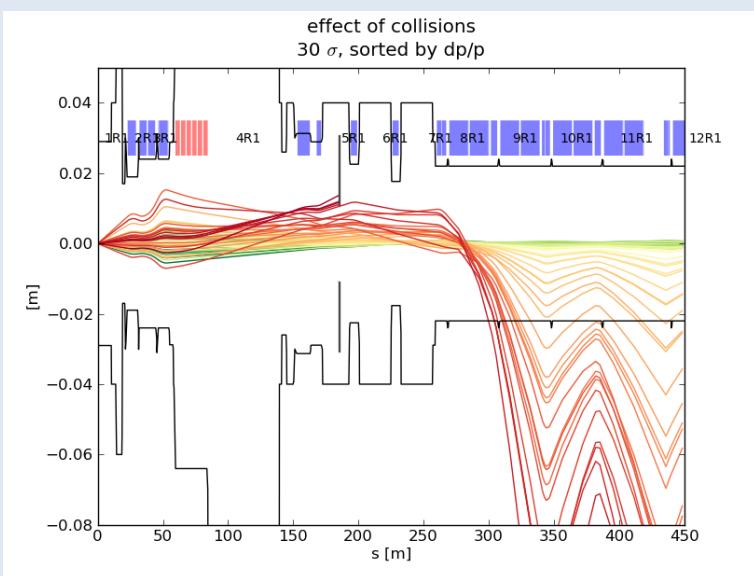

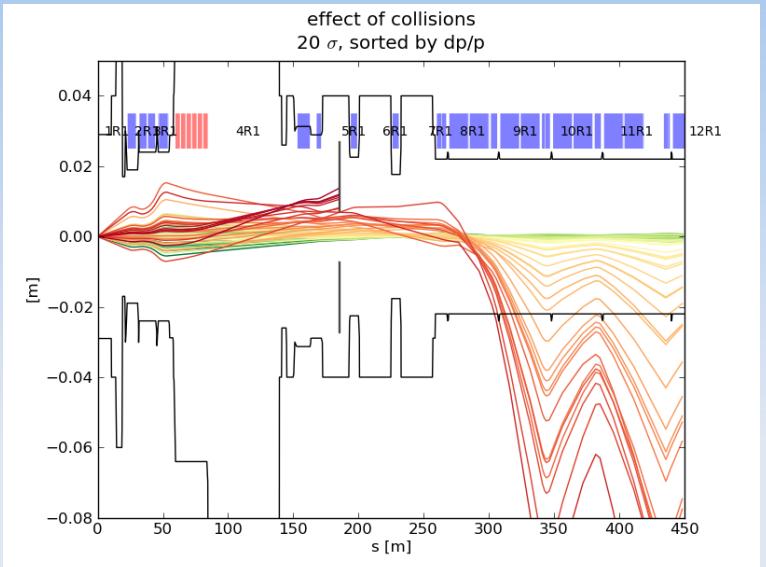

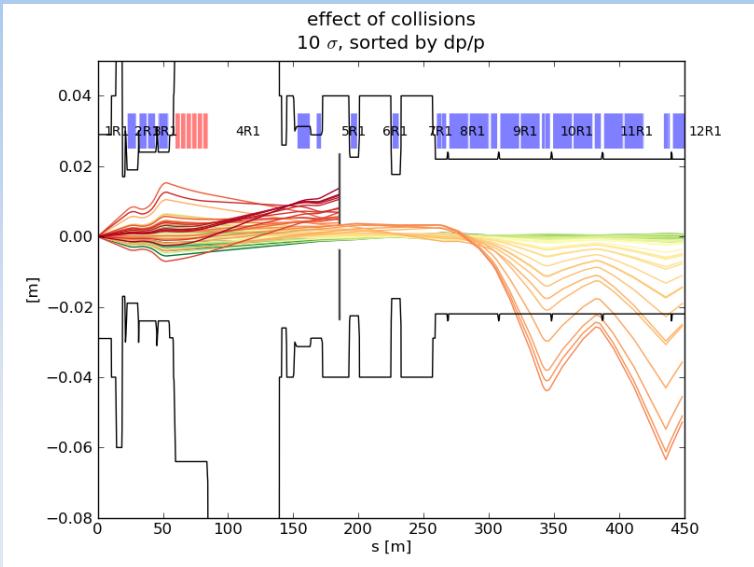

# Debris tracking benchmarking at 4 TeV: TCL scans

# Measured losses at 4 TeV: TCL scan out

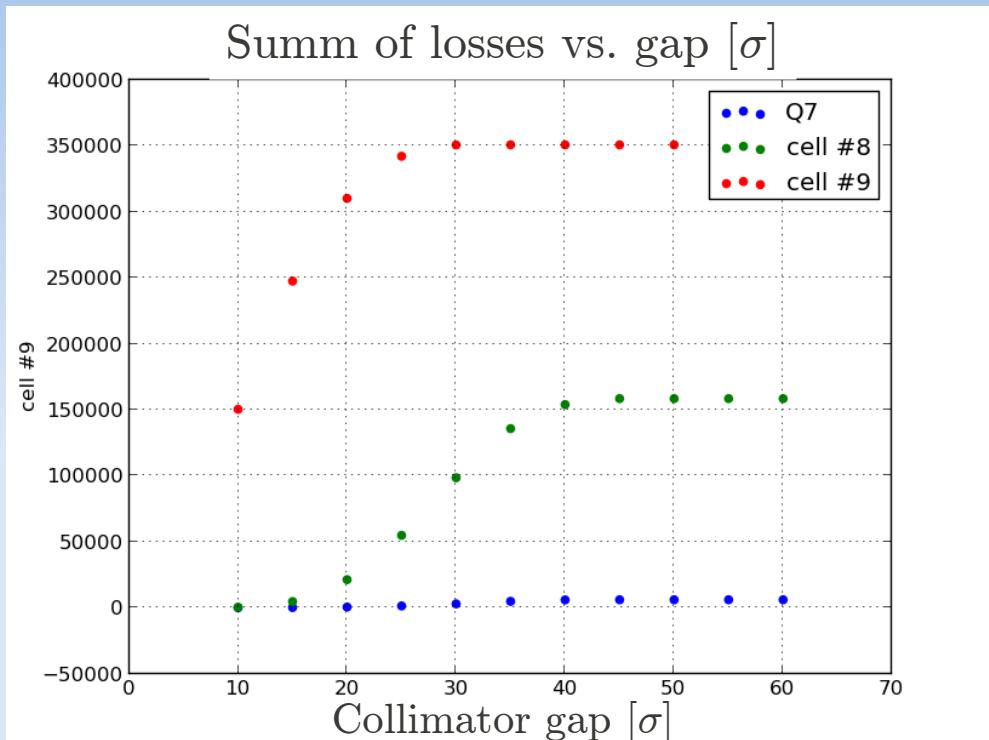

- Loss at TCL decrease: TCL retracting
- Losses downstream TCL increase: losing protection
- Different loss evolutions depending on the position
- Can we reproduce such behaviours?

# TCL scan

- At first turn
- More and more particles survive TCL
- Particles with higher dp/p
- Lost closer to the TCL

# Simulated TCL scan (4 TeV)

- Sum of aperture losses in Q7, cell 8, cell 9
- Work in progress: Trying to match these results to the measurements
- The furthest the losses are, the sooner they increase
- Very encouraging result

# Conclusion

- First results, with halo and debris tracking, for different optics
- Halo tracking validated by loss maps
- Ongoing effort to understand in details TCL scan SixTrack simulations knowing the measurements
- Discovered possible new limitations: peaks in arc 81
- Outlook
  - Test different TCL settings for protection
  - Still perfect machine. Add errors
  - Only IP1: simulation from other IPs
  - Simulate B2

Thank you for your attention

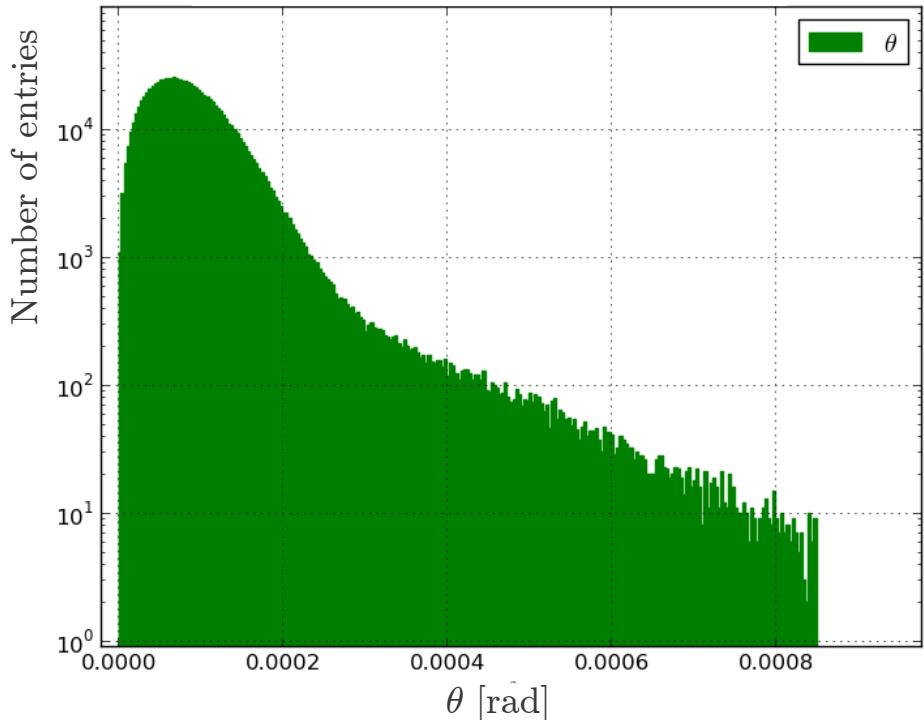

# Effect of collisions: particles distribution

- Distributions of protons with  $\theta$  and  $dp/p$  from FLUKA
- Only inelastic contributions
- $x' = \tan(\theta)\sin(\varphi)$
- $y' = \tan(\theta)\cos(\varphi)$
- Distribution of  $\theta$  is cut at the opening of the TAS
- Distribution of  $dp/p$  is cut at 0.1

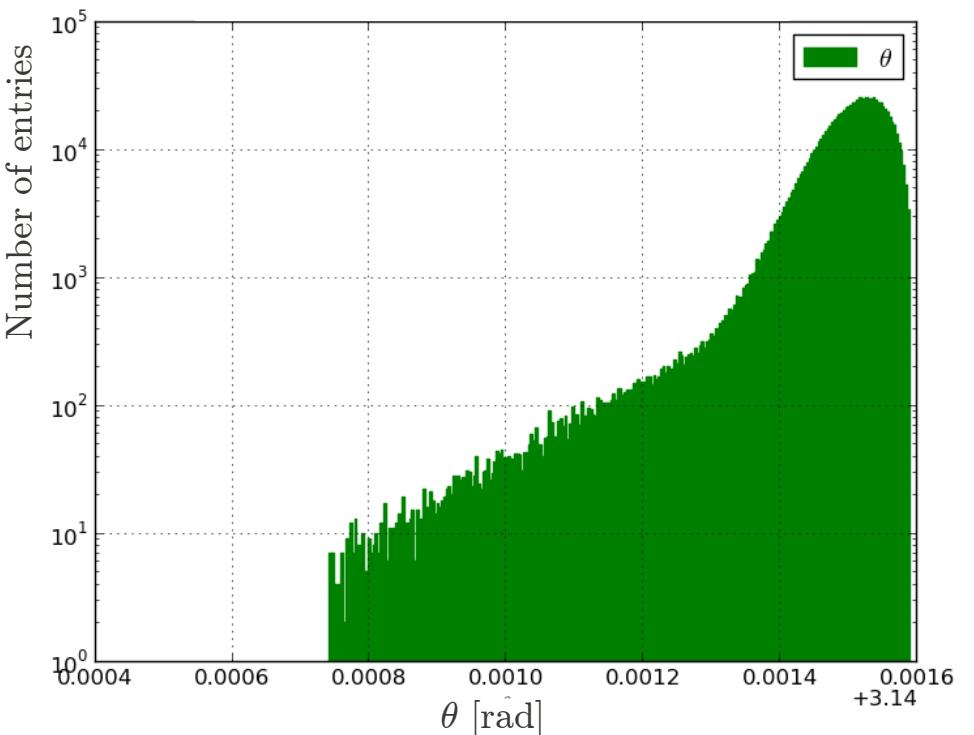

# Distributions of $\theta$ (4 TeV)

Distribution of  $\theta$  around 0

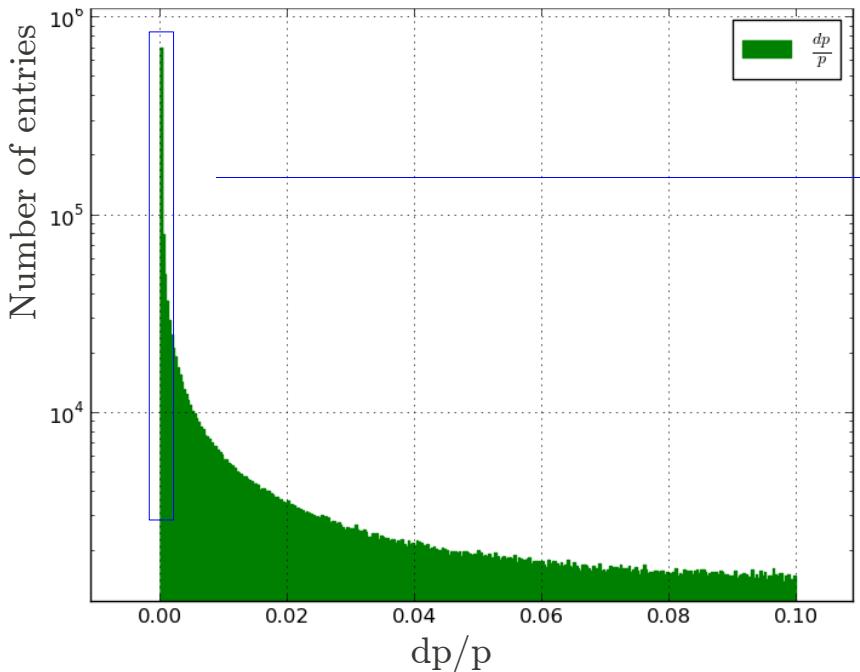

Distribution of  $\theta$  around  $\pi$

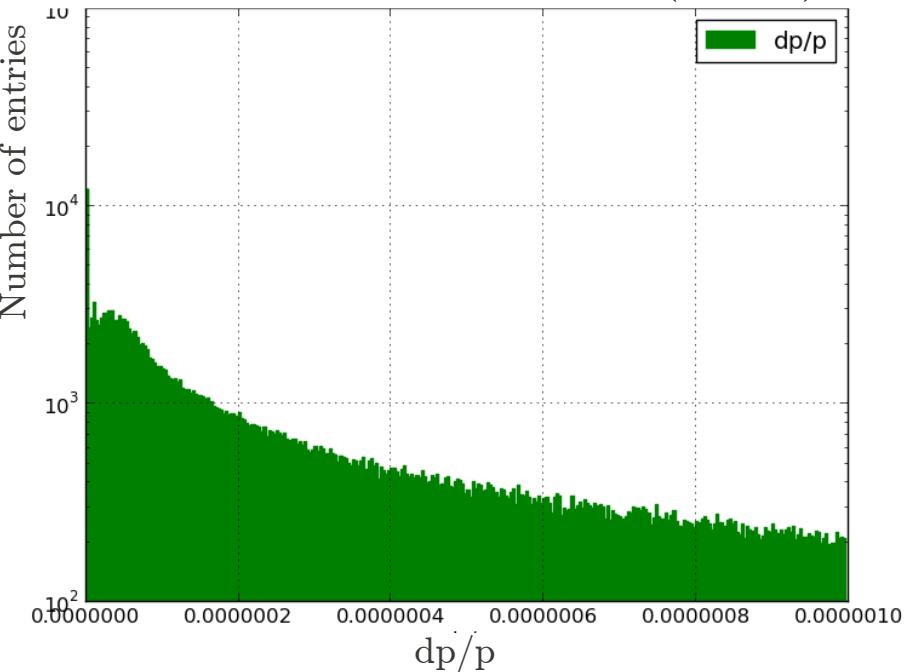

- Effect of the cut
- Used to generate the extra kicks in  $x'$  and  $y'$
- These distributions are wider than the nominal ones.

# Distribution of $dp/p$ (4 TeV)

Momentum distribution of protons

Momentum distribution (zoom)

- Most protons with small  $dp/p$ , but long tail (cut)
- Protons with higher  $\theta$  or  $dp/p$  would be lost anyway during tracking: momentum & betatron acceptance
