## Evolution of the helicity and transversity Transverse-Momentum-Dependent parton distributions

*Wednesday 24 April 2013 11:20 (20 minutes)*

We examine the QCD evolution of the helicity and transversity parton distribution functions when including also their dependence on transverse momentum. Using an appropriate definition of these polarized transverse momentum distributions (TMDs), we describe their dependence on the factorization scale and rapidity cutoff, which is essential for phenomenological applications.
