

SiPM properties study
by
INFN Roma-1
and
University “la Sapienza” of Rome
- first results

*C. Bosio, S. Gentile,
E. Kuznetsova, F. Meddi*

SILICON PHOTOMULTIPLIERS

Golovin and Sadygov, mid of 90s

CELLS -> MATRIX

- insensitive to magnetic field
- fast (≤ 100 ps) response
- small size
- nowadays - reasonable price

SIPM CUSTOMERS AND PRODUCERS

AHCAL for the ILC detector

scintillator tiles with WLS fiber and SiPM

*HEP, astrophysics,
medical applications, ...*

SiPM produced by :

- *MEPhI / PULSAR (Russia)*
- *Obninsk Uni / CPTA (Russia)*
- *HAMAMATSU (Japan)*
- *IRST (Italy)*
- *SensL (Ireland)*
- ...

SIPM STUDIES at ROMA

First steps :

- *Development of the test setup and measurement procedure*
- *General measurements of the SiPM response to LED light (single photoelectron spectra)*
- *Comparison of SiPM produced by different manufacturers*

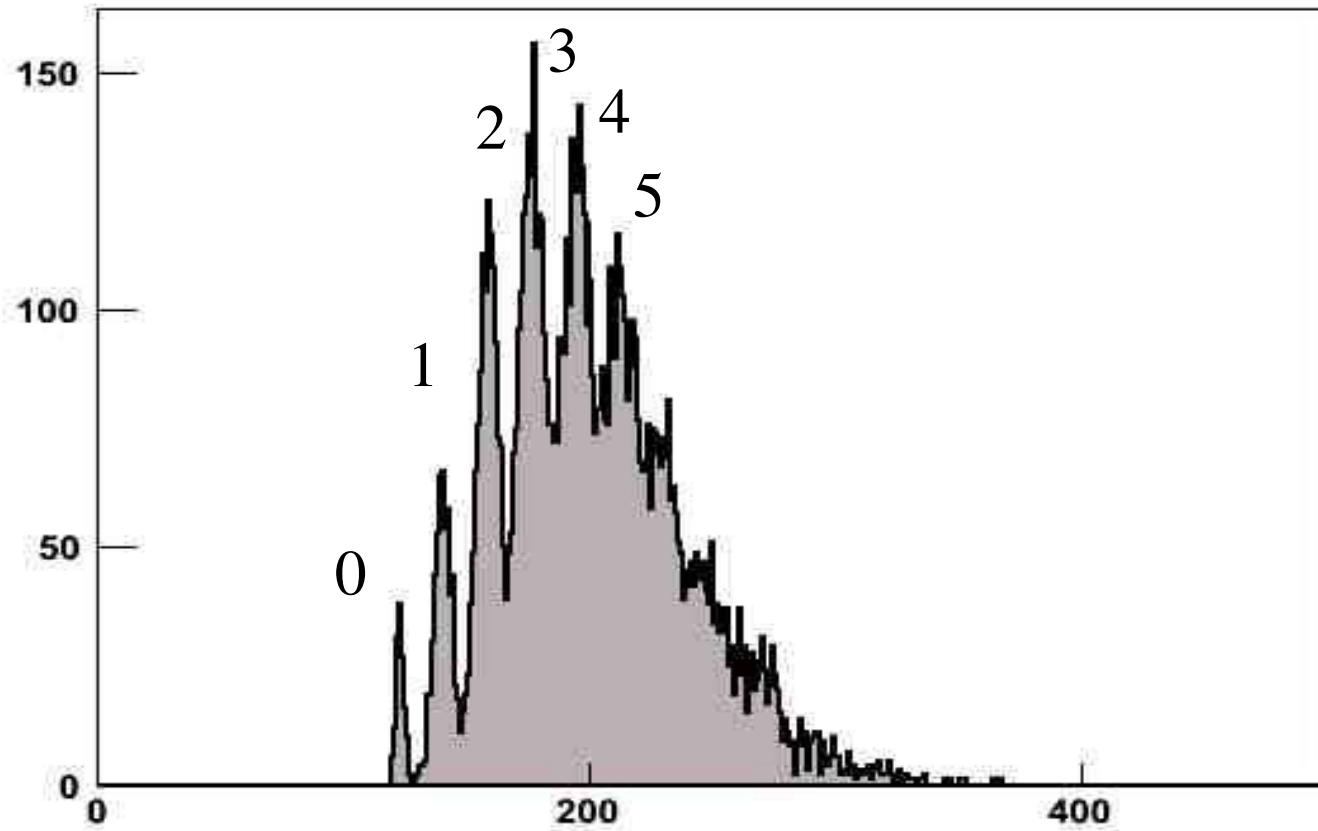

SiPM samples :

- *Obninsk Uni / CPTA* ~ 1x1 mm, ~500 cells
- *HAMAMATSU* 1x1 mm, 1600 cells
- *FORIMTECH / CPTA* ~ 1x1 mm, ~500 cells
- *IRST* 1x1 mm, 625 cells
- *SensL* 1x1 mm, 620 cells

Measurements :

- *Current-Voltage characteristics*
- *Response to low-intensity light (UV LED)*

SINGLE PHOTOELECTRON SPECTRUM

Parameters :

- *Gain*
- *Width of the pedestal and single pe peak*
- *Efficiency of light registration*
- *Crosstalk between pixels*

LED DRIVE

Low intensity fast light pulses :

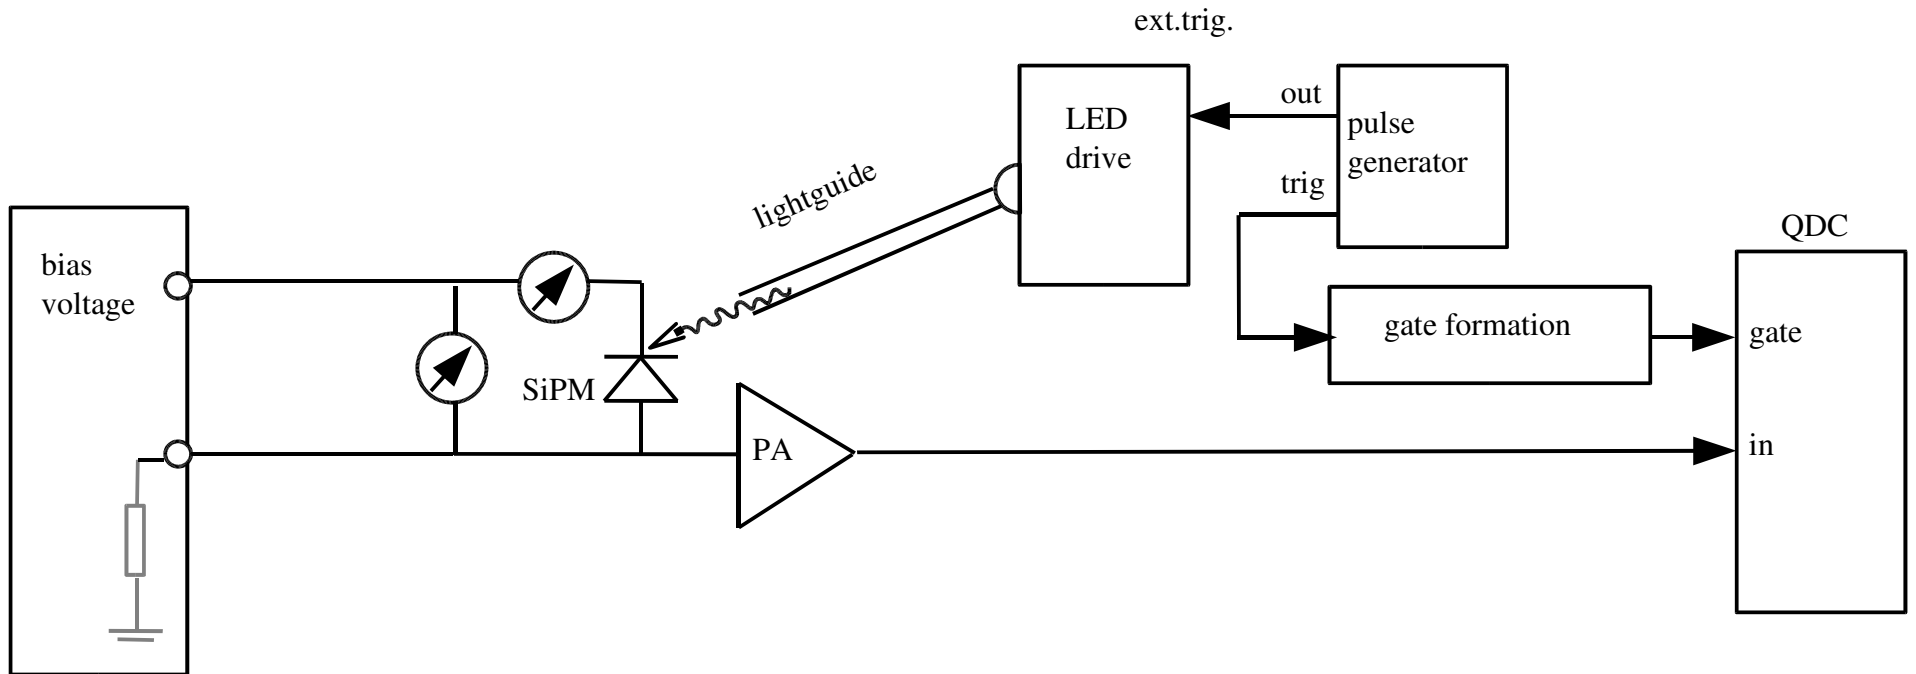

LED drive from Institute of Physics ASCR Prague

- *developed for Calibration and Monitoring Board*
- *external trigger*
- *variable current pulse width*
- *variable current pulse amplitude*

- Common input for signal LED-trigger, lemo, 50Ω
- One 12V (60mA) supply, protection
- Rise time 2ns,
tested with P5050 scope probe (8pF, 500MHz)
C=8pF, L=30nH
 $f_{res}=290\text{MHz}$

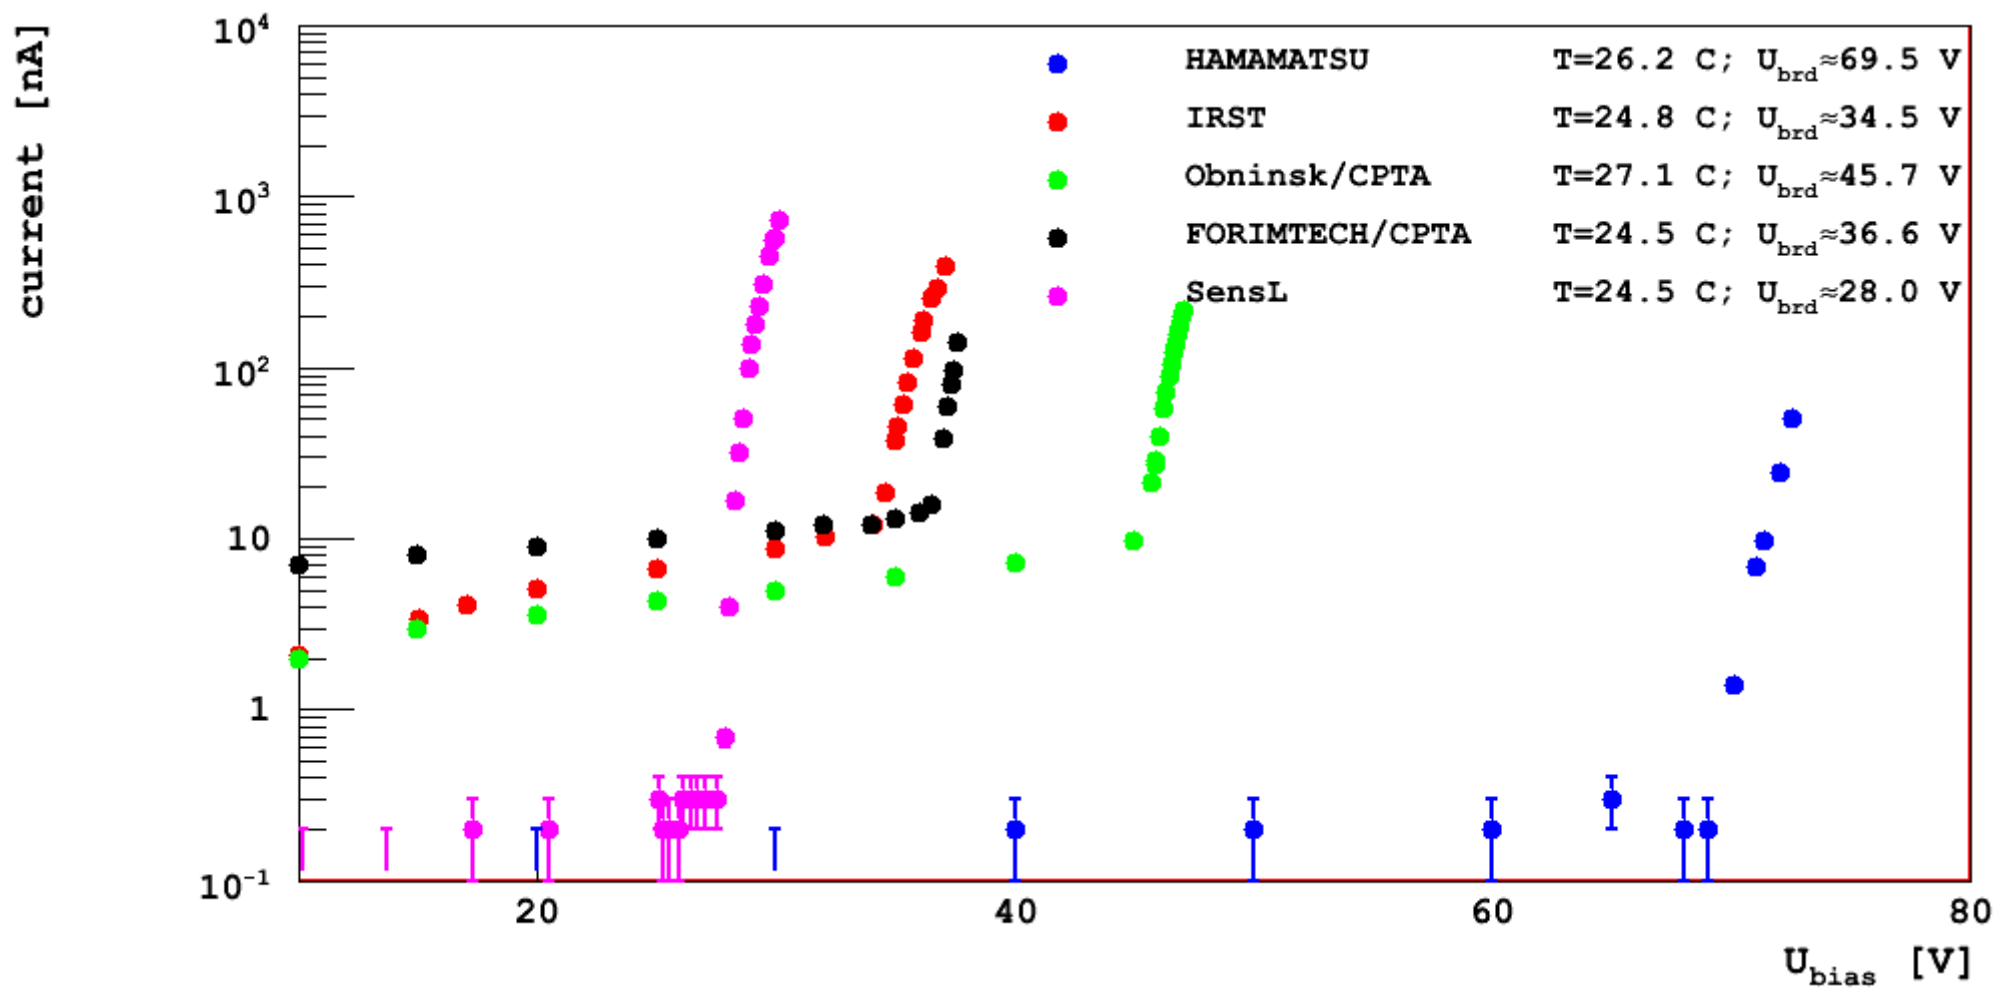

SETUP @ ROMA1

SETUP @ ROMA1

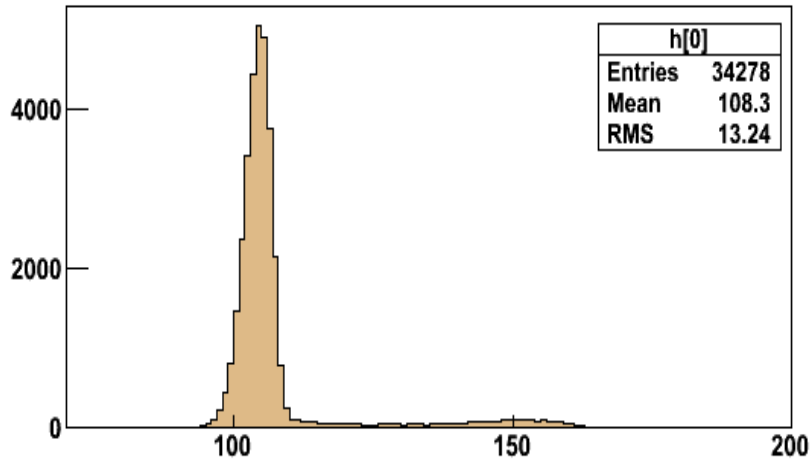

FIRST RESULTS - IV

FIRST RESULTS – light response

27 Apr 2007
16:43:48

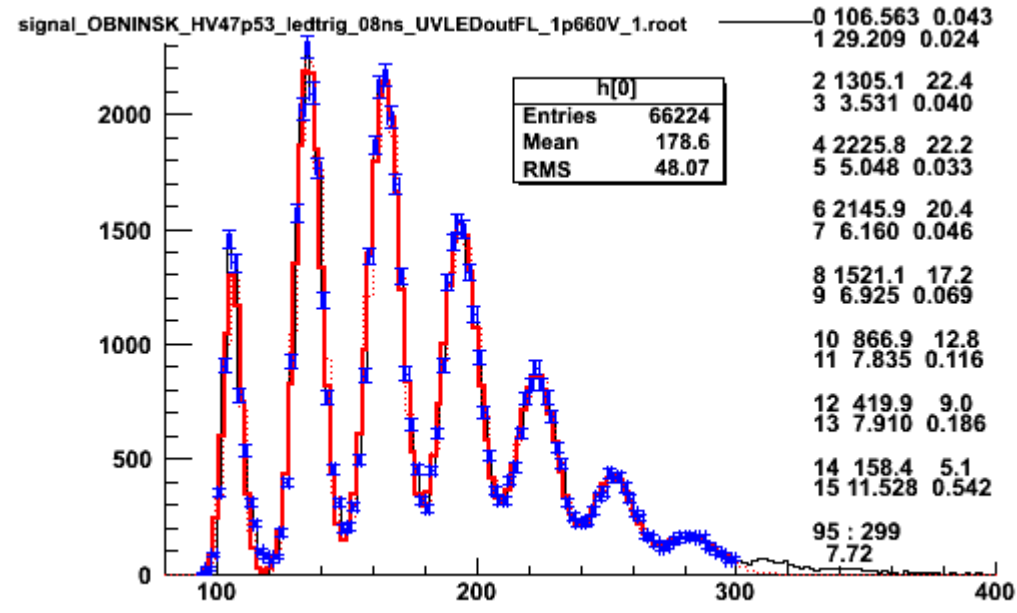

SPECTRA TREATMENT : INITIAL PROCEDURE

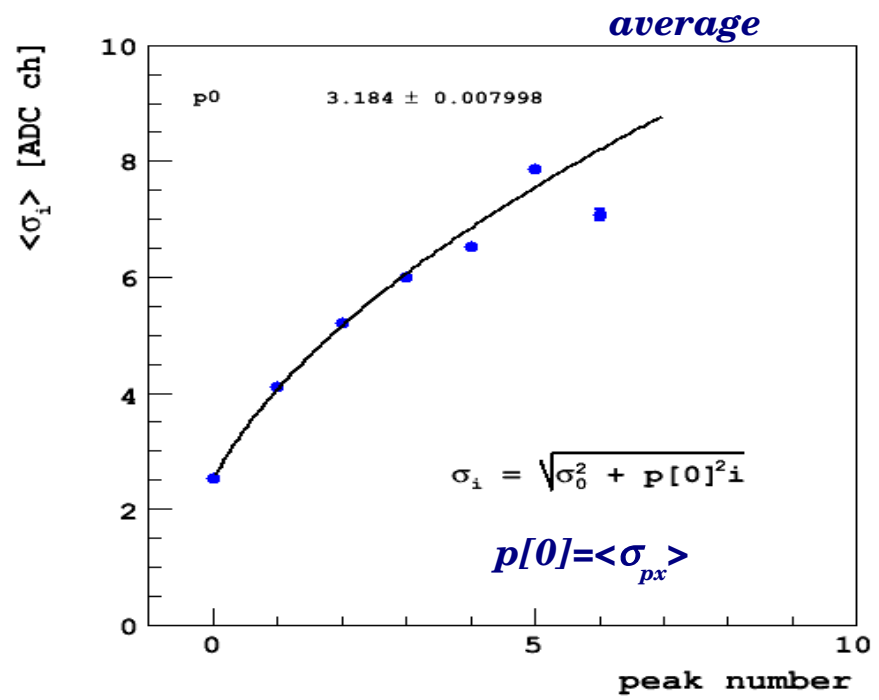

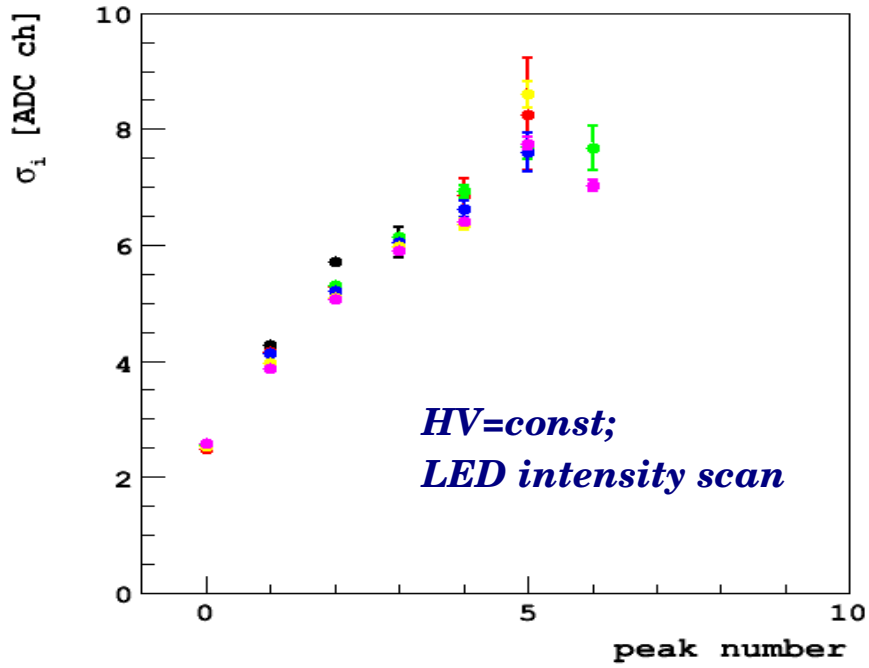

Fit parameters :

- pedestal
- peak distance
- gauss N_i
- gauss σ_i

(no eff. nor x-talk consideration)

Intensity scan @ bias_U=const : x-check

SPECTRA TREATMENT : PRELIMINARY RESULTS

No temperature control yet :

- $\langle T \rangle \sim 24 \text{ C}$
- $\Delta T(\text{one sample}) \approx 2 \text{ C}$
- $\Delta T(\text{all}) \approx 4 \text{ C}$

SPECTRA TREATMENT : PRELIMINARY RESULTS

SPECTRA TREATMENT : PRELIMINARY RESULTS

$$\text{gain} \sim N$$

$$\sigma_{\text{px}} \sim \sqrt{N}$$

$$\langle \sigma_{\text{px}} \rangle \sim \sqrt{(N + \sigma_{\text{nonun}}^2)}$$

$$\text{gain}/\langle \sigma_{\text{px}} \rangle \sim N, \quad N \ll \sigma_{\text{nonun}}^2$$

$$\text{gain}/\langle \sigma_{\text{px}} \rangle \sim \sqrt{N}, \quad N \gg \sigma_{\text{nonun}}^2$$

if $\sigma_{\text{nonun}}^2 = \text{const}(N) ??$

NEXT STEPS

Highest priority :

- *setup improvement (noise reduction, temperature control...)*
- *further development of the spectra treatment procedure (efficiency, x-talk)*
- *measurement program extension*
- *repeat the measurements for more samples*

After establishment of the full measurement procedure:

- *measurements of PDE as a function of light wavelength*

THANKS!
