

Which equipment is limiting the cycling rate to 1.2s ? (old or new equipment?)

What is the additional cost if new equipment would have to be compatible with 900 ms instead of 1.2 s?

How much would remain to be invested for upgrading old equipment for 900 ms cycling?

Are we only considering 900 ms cycling for all users, or is there a possibility to cycle at 900 ms for LHC only? Is there a significant different in cost?
