A new vendor for high volume production of silicon particle detectors

Wednesday 13 February 2013 12:20 (20 minutes)

Most modern particle physics experiments use silicon based sensors for their tracking systems. These sensors are able to detect particles generated in high energy collisions with high spatial resolution and therefore allow the precise reconstruction of particle tracks. So far only a few vendors were capable of producing silicon strip sensors with the quality needed in particle physics experiments. Together with the European-based semiconductor manufacturer Infineon Technologies AG (Infineon) the Institute of High Energy Physics of the Austrian Academy of Sciences (HEPHY) developed planar silicon strip sensors in p-on-n technology. This talk presents the development, production, electrical characterization, beam tests and gamma-irradiation of the first sensors produced by Infineon. This cooperation offers the possibility to establish Infineon as a high quality vendor for particle physics detectors capable of a high volume production required by future particle physics experiments.
