

Solid State and bio-physics at ISOLDE

Karl Johnston
ISOLDE/CERN

karl.johnston@cern.ch

FPRIB2012, Kolkata

Outline

- Overview of the community
- Introduction to techniques used in nuclear solid state physics
- Techniques used at ISOLDE
- Focus on some recent results in solid state and biophysics.

SSP @ ISOLDE: Diverse community

Solid State physics:

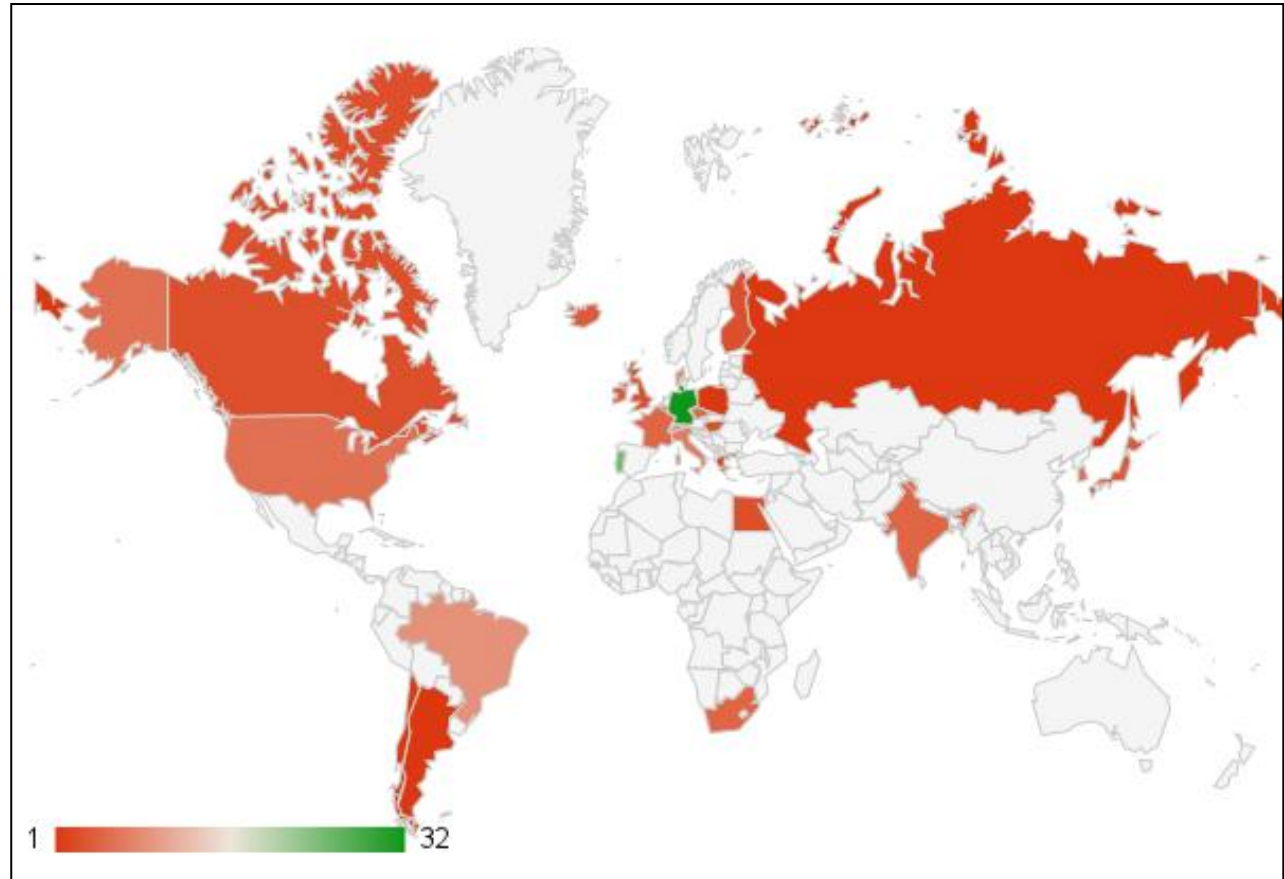

Semiconductors,
Metals

Materials scientists:

High Tc
Superconductors,
Multiferroic materials

Biophysics:

structural properties &
role of heavy metals in
proteins, DNA.

SSP collaborations

Running experiments/letters of intent	24
Participating countries	26
Scientists	160

Radioactive isotopes for solid state physics? Why & How??

Nothing is more easy to detect with high sensitivity than nuclear radiation, i.e. very low concentrations of radioactive impurity atoms in a material can be detected.

The radioactive isotopes (“probes”) act as “spies” transmitting information with atomic resolution via their decay.

- Crucially: what information do you get?????
- Adds extra dimension to “normal spectroscopies” e.g. optical / electrical characterisation of semiconductors
- Provides extremely local probe which is applied to variety of systems

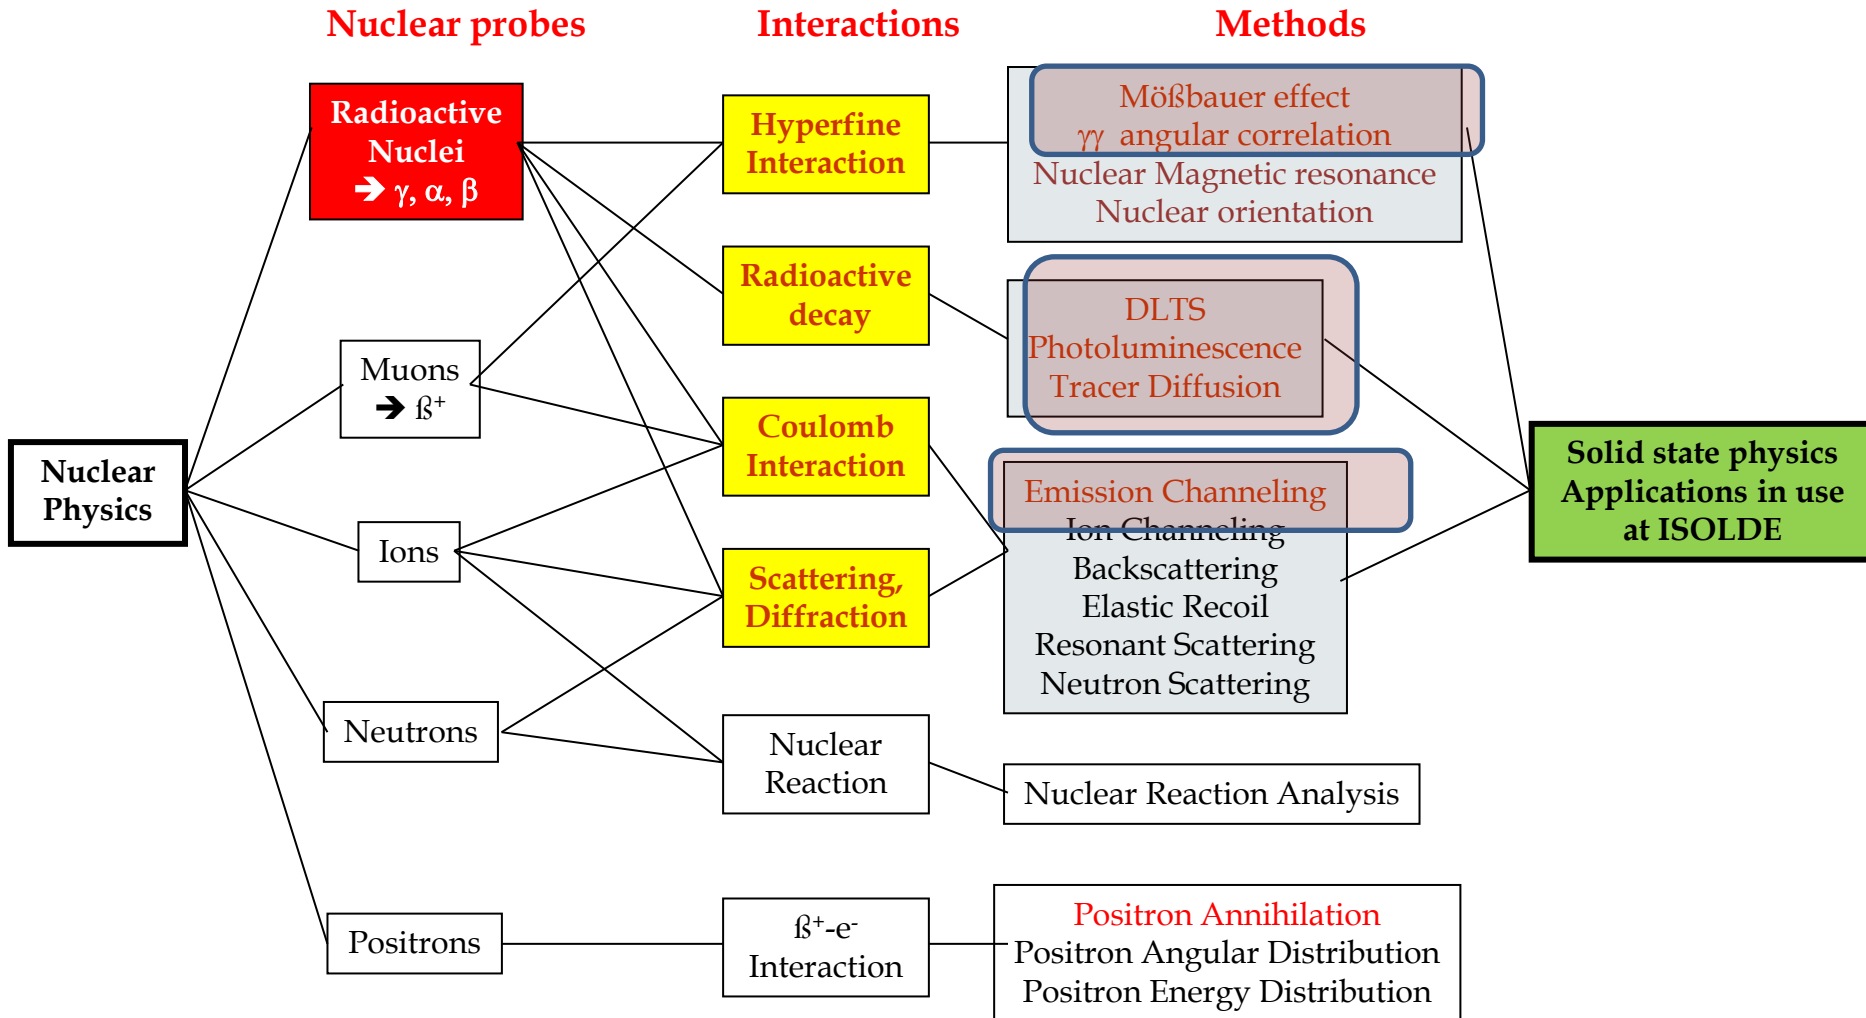

You need

A facility providing a large variety of radioactive isotope (if possible, isotopically clean)

You have to introduce the isotopes into the semiconductor

- by ion implantation
- by diffusion
- during crystal growth
- by nuclear reaction with one of the constituents of the solid

Techniques used at ISOLDE

Techniques & facilities available

Hyperfine Interactions:

- **PAC** (See Prof Das' talk)
 - 9 γ - γ machines on-site
 - 4 detectors; 6 detectors: analogue and digital.
 - Online UHV beamline for surface physics
- **Mossbauer Effect**: 3 online chambers available.
- **β -NMR** including novel system developed for biophysics.

Lattice location using **emission channelling**: 3 offline and 1 online setup

Radiotracer diffusion: online and offline systems

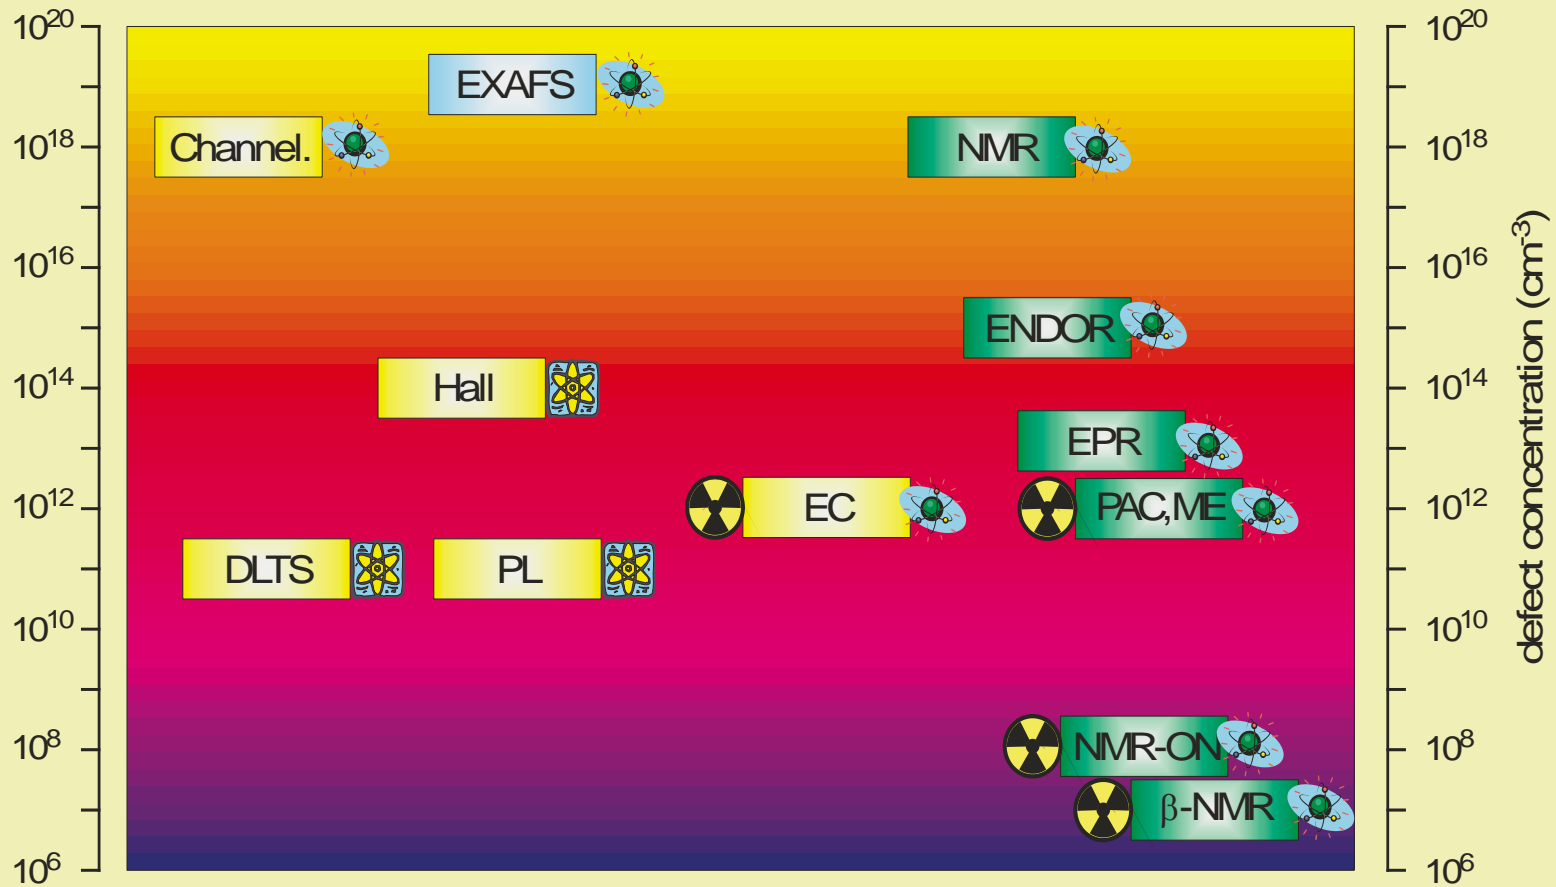

Semiconductor spectroscopy: full **PL** and **DLTS** characterisation labs

Dedicated suite of offline labs for sample preparation, treatment and measurement.

Semiconductor Spectroscopy

sensitive to chemical nature  or electronic properties 

(some require radioactive isotopes )

Magnetic semiconductors studied using Mossbauer spectroscopy

Development of ^{57}Mn beam in late 1990s (with laser ionisation) brought about a new era in Mossbauer experiments at ISOLDE.

- Very clean, intense beam of ^{57}Mn ($>3 \times 10^8 \text{ ions sec}^{-1}$)
- Allows collection of single Mossbauer spectrum in ~ 3 mins.
- Able to collect many hundreds over course of a 3 day run.
- Allows low concentrations of probe atoms to be used ($\sim 10^{-4} \text{ At\%}$)

Experimental setup

ZnO: a ferromagnetic semiconductor?

(unit)

$$B_{\text{ext}} = 0 \text{ T}$$

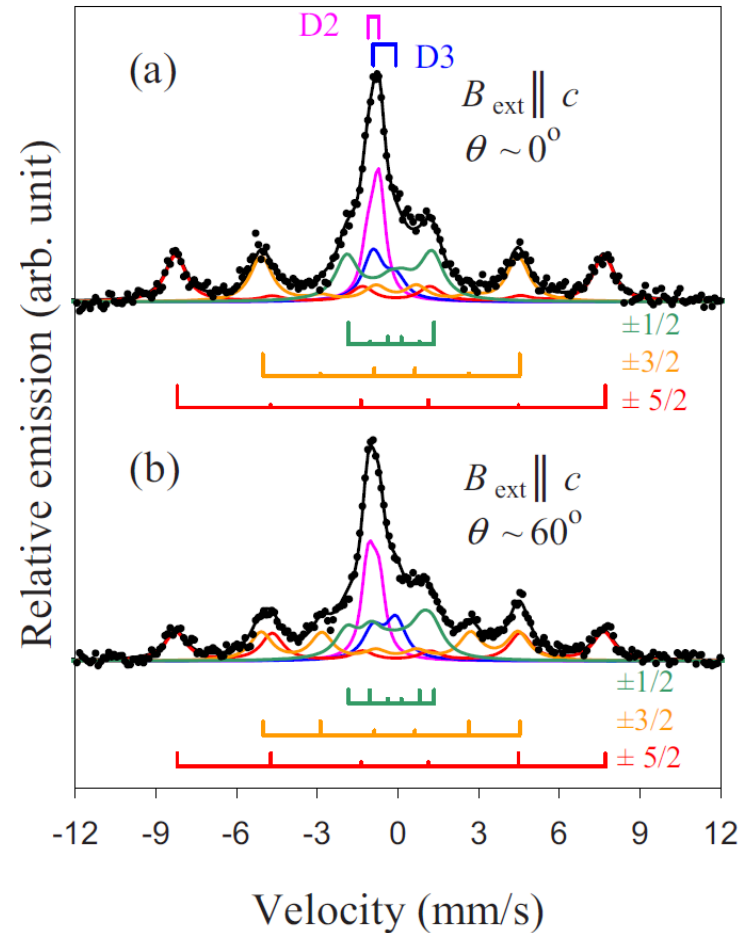

Not quite.

Further results in an external magnetic field show that the spectrum shown to be a slowly relaxing paramagnetic system .

Gunnlaugsson *et al* (APL **97** 142501 2010)

room temperature!!!).

- Time to celebrate?

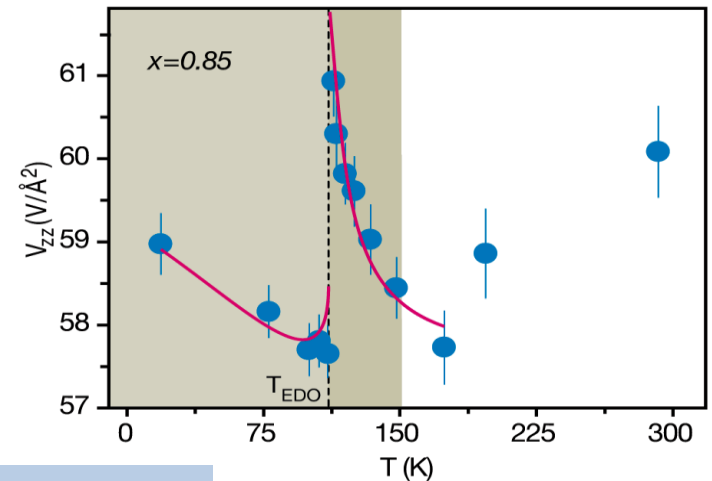

More on ZnO

After high-dose implantations, precipitates of Fe-III are formed. These form clusters yielding misleading information about the nature of magnetism in ZnO (as reported by many groups over the last number of years).

PAC results: Local Probe Studies / $\text{Pr}_{1-x}\text{Ca}_x\text{MnO}_3$ system

Results: Electric susceptibility / spontaneous polarization below T_C

$x=0.35 \rightarrow T_{EDO} = 206$ K, $x=0.4 \rightarrow T_{EDO} = 218$ K,

$x=0.85 \rightarrow T_{EDO} = 112$ K

Described as first-order dielectric phase transition below T_{CO}

A.M.L. Lopes et al., *Phys. Rev. Lett.* 100, 155702 (2008)

Emission channelling: locating impurity atoms in the lattice

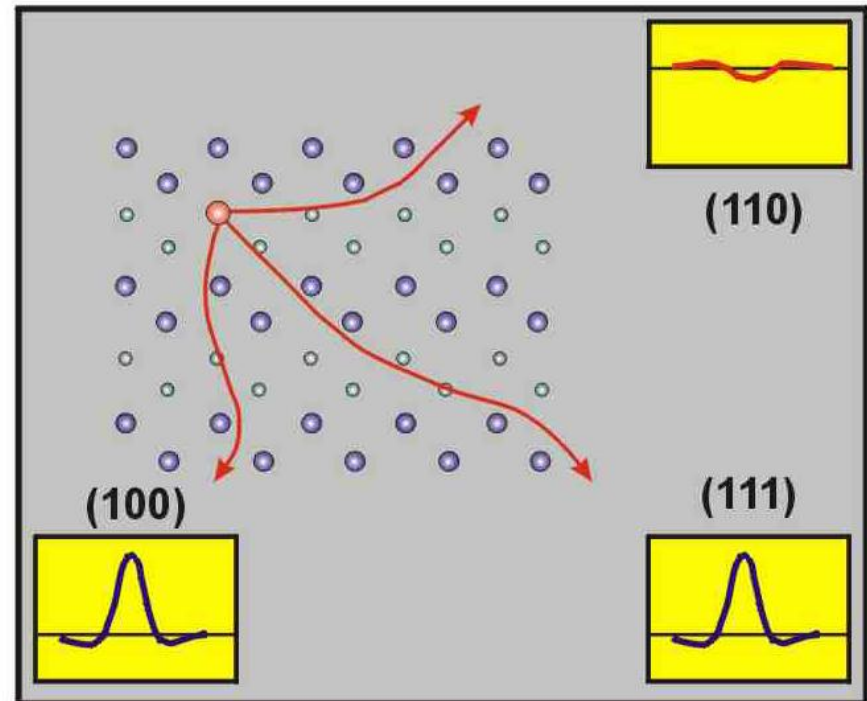

Channelling of charged particle in crystal, channels along high symmetry directions.

Emission channelling: locating impurity atoms in the lattice

Since 2009,
online system
available, able to
measure isotopes
with half-lives of
~1min.

Position sensitive
detectors
produced at
CERN (Medipix
project).

Spintronics: Location of Mn in Ga_{1-x}Mn_xAs

- GaAs: a dilute magnetic semiconductor, not yet at room temperature.
- Emission channelling results showed that Mn is surprisingly stable at interstitial sites in GaAs (400C).
- Results that have consequences for “defect engineering” of this material.

FIG. 1. (Color online) [(a)–(d)] Normalized experimental β^- emission channelling patterns in the vicinity of the $\langle 111 \rangle$, $\langle 100 \rangle$, $\langle 110 \rangle$, and $\langle 211 \rangle$ directions following annealing at 300 °C. [(e)–(h)] Corresponding best fits yielding 71% and 29% of the Mn atoms on S_{Ga} and T_{As} sites, respectively.

PL Characterisation of Semiconductors

- ✓ One of the principal techniques in semiconductor research.
- ✓ High Spectral resolution
- ✓ Non-destructive
- ✓ No need for contacts
- ✓ Very sensitive (can probe ppb)
- ✓ Relatively flexible and straightforward
- ✓ Can be extended to include external perturbations.

- X Not quantitative
- X Low concentrations may be more optically efficient
- X Lack of chemical information (except for some rare cases where isotope shifts are observed)

PL + L-DLTS apparatus at ISOLDE

LASER

- HeCd (3,8 eV)
- Nd:YAG (2,3 nm)
- Diode (1,9 nm)

Cryostat

He-Bathcryostat (1,5 – 300 K)
Closed cycle

Monochromator

- Focus: 0,75 m
- Gratings: 150 – 1800 l/mm

Detectors

- CCD-camera (1,1 - 6,2 eV)
- Ge-Diode (0,7 - 1,5 eV)

Fundamental properties of donors in ZnO

Time

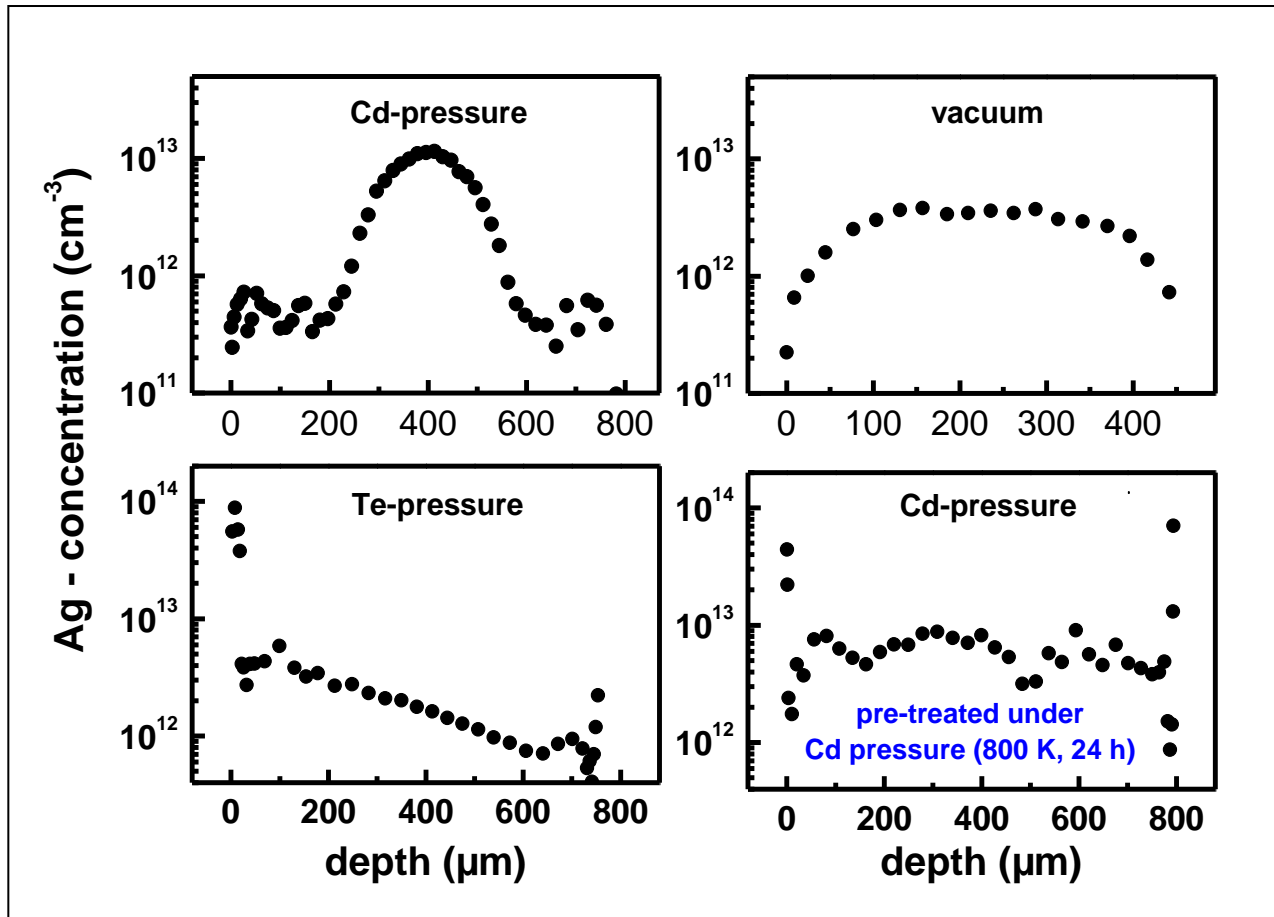

I_8 feature decays as Ga decays; So does the weak I_1 line; DD_2 grows as Ge is produced. First chemical identification of Ga and Ge in ZnO, (PRB 73, 165212 (2006)) and PRB 83 125205 (2011))

Diffusion: experimental procedure

^{111}Ag Implantation

Diffusion: Ag in CdTe

$T_{\text{diff}} = 825 \text{ K}$

$t_{\text{diff}} = 60 \text{ min}$

Shapes of diffusion profiles strongly depend on external vapor pressure

Online Diffusion

- **Implantation**
- **Diffusion annealing up to 1800 °C**
- **Sample sectioning by ion sputtering**
- **Catching the sputtered ions by a tape system**
- **In situ activity measurement**
- **Remote control**

Biophysics at ISOLDE: Radioisotopes for Probing Biomolecular Functionality in Living Matter

PAC isotopes used for biophysics at ISOLDE:

parent	half-life	decay	isomer	half-life (ns)

Metal Ion Binding Site Structure: Fast inter-conversion between species

Matzapetakis *et al.* J. Am. Chem. Soc. **2002**, 124: 8042; Lee *et al.* Angew. Chem., **2006**, 45: 2864; Peacock *et al.* Proc. Nat. Acad. Sci. **2008**, 105: 16566

De novo designed heavy metal Ion binding proteins: ns dynamics

Temp [°C]	τ_1 [ns]	τ_{-1} [ns]
1	52	48
20	42	36
35	28	20
50	19	12

Stachura et al. Manuscript in preparation

In vivo experiments

Hg(II) binding to barley

- 5-7 days-old plants
- Plant inserted into test tube.
- Fast uptake of Hg(II) (<1h)
- Bound to large molecules, similarities to HgS₂ compounds

Beta-NMR applied to biophysics

Beta-NMR

- Cu, Zn, Mg, Mn, Fe, Ni
- Measurement of electric field gradient

- Cu(I) is “invisible” in most (except X-ray and nuclear) spectroscopic techniques because it is a closed shell ion
- Cu(I)/Cu(II) are essential in many redox processes and electron transport in biology

Advantages and Limitations of PAC Spectroscopy for biophysics

Advantages:

- Characterisation of structure and dynamics at the PAC probe site (including rotational correlation times)
- High sensitivity to **structural changes**
- Small amount of PAC probe needed (in principle about **1 pmol**)
- **Different physical states** (crystals, surfaces, solutions, *in vivo*...)
- Mechanically stable, allowing for stirring, flow, ...

Limitations:

- Suitable PAC isotopes do not exist for all elements
- PAC isotope **must bind strongly** to the molecule of interest
- Spectral parameters do not uniquely determine structure
- After effects can cause problems (in particular for EC). (**¹¹¹In**)
- Production of PAC-isotopes

Summary

Solid state physics/biophysics: a very active experimental programme at ISOLDE

- Radioactive measurements complement work at home laboratories
- Unique information – be it chemical or local – which is only achievable using radioactive implantations/probes.
- Synergy between groups e.g. extension of biophysics methods for studying graphene and fullerenes (Prof Das).
- Ability to profit from the huge range of beams available at ISOLDE (especially now with online *and* offline setups).
- Many new developments under preparation e.g. β -NMR for biophysics
