

From Raw Data to Physics Results

Jamie Boyd
CERN

Outline

- Summary
 - Brief overview of the full lecture course
- A simple example
 - Measuring the Z^0 cross-section
- Reconstruction & Simulation
 - Track reconstruction
 - Calorimeter reconstruction
 - Physics object reconstruction
 - Simulation
- Physics Analysis
 - Data Quality
 - $Z' \rightarrow ll$
 - $H \rightarrow \gamma\gamma$
 - $H \rightarrow ZZ \rightarrow 4l$
- Computing infrastructure
- The End!

Today's Lecture

Disclaimer : Much of the content based on previous years lectures
Thanks to G. Dissertori

Section 1: Summary

Data Analysis Chain

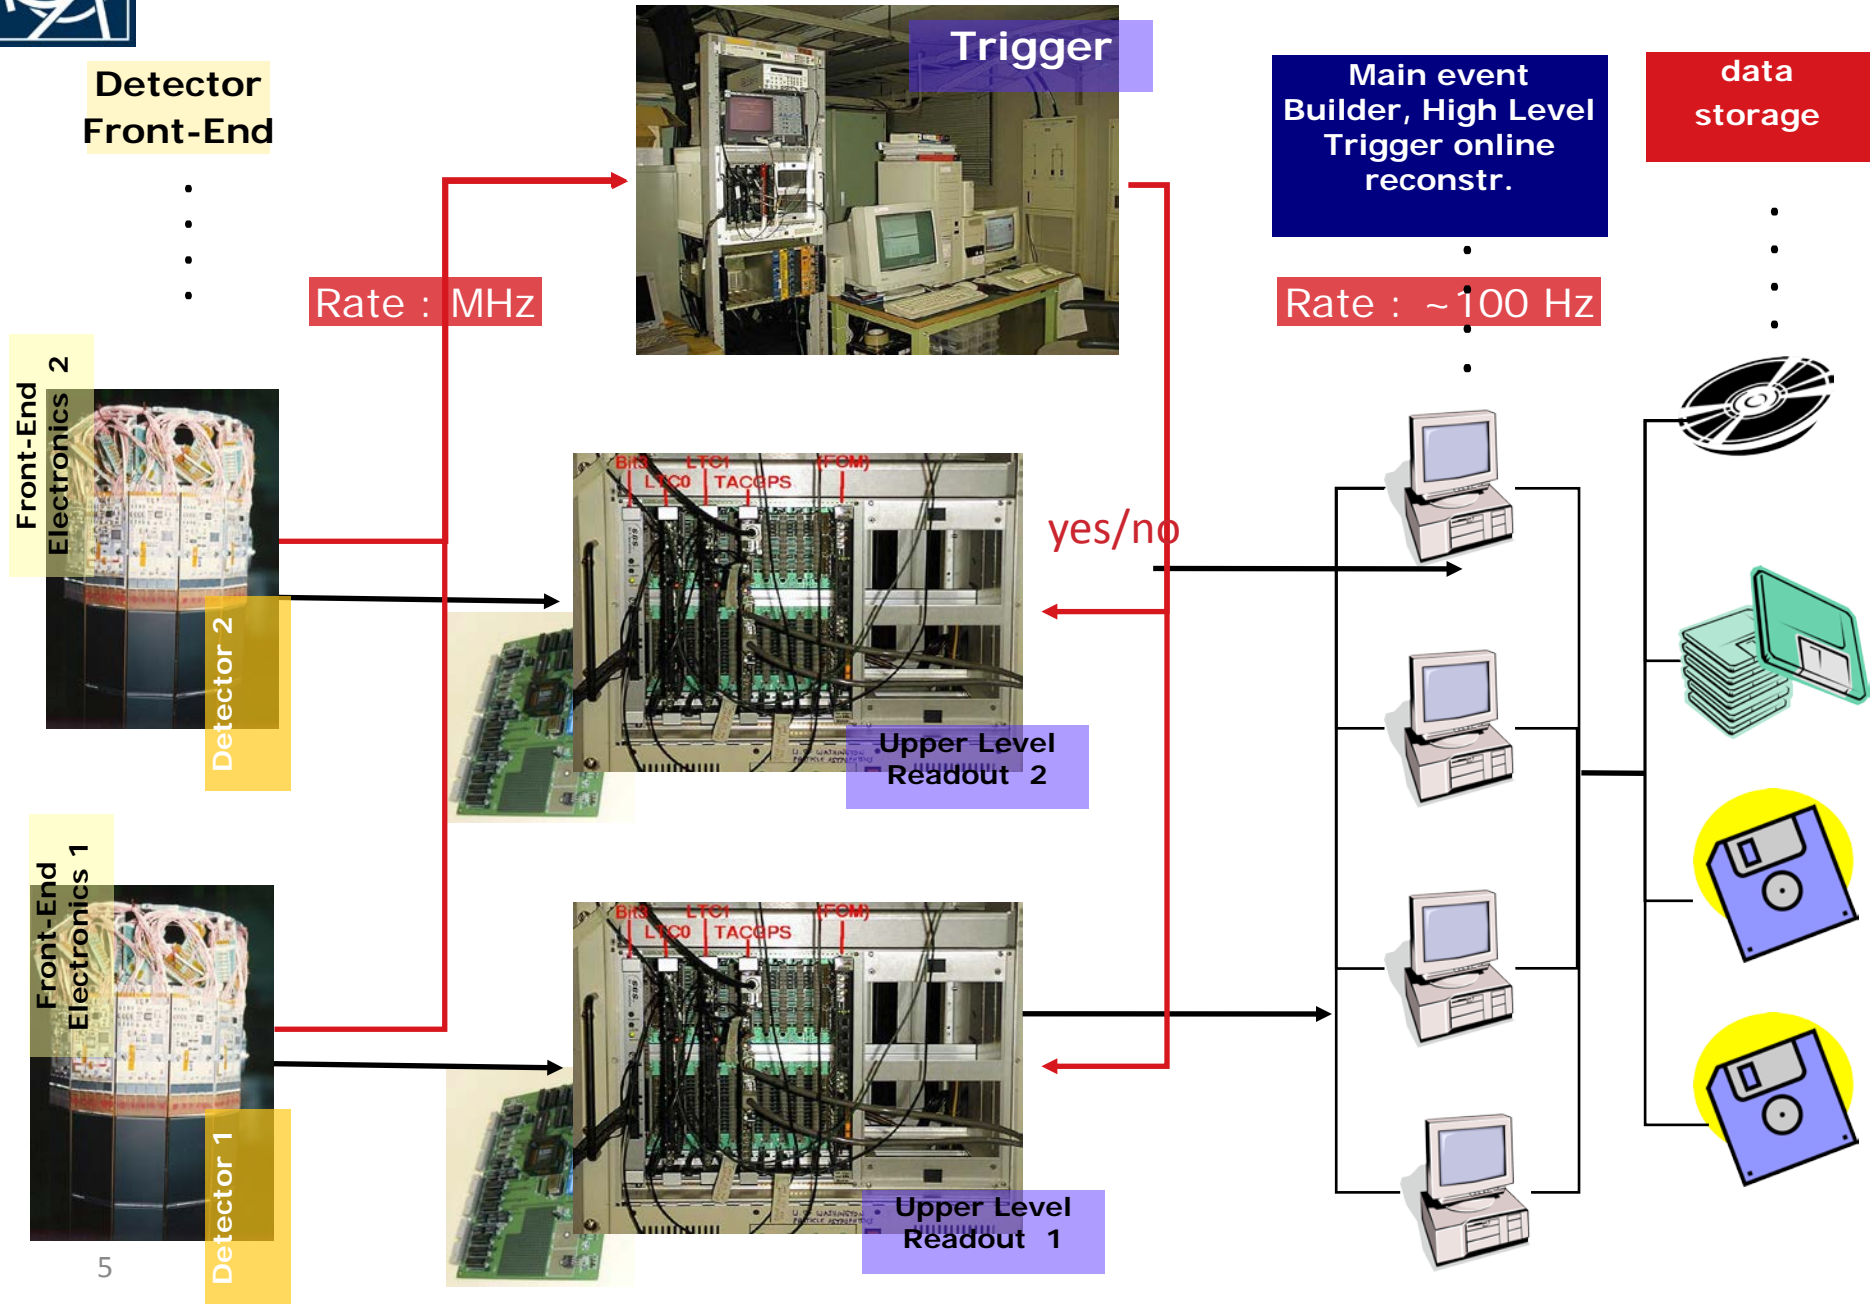

- Have to collect data from many channels on many sub-detectors (millions)
- Decide to read out everything or throw event away (Trigger)
- Build the event (put info together)
- Store the data
- Analyze them
 - reconstruction, user analysis algorithms, data volume reduction
- do the same with a simulation
 - correct data for detector effects
- Compare data and theory

This lecture course!!

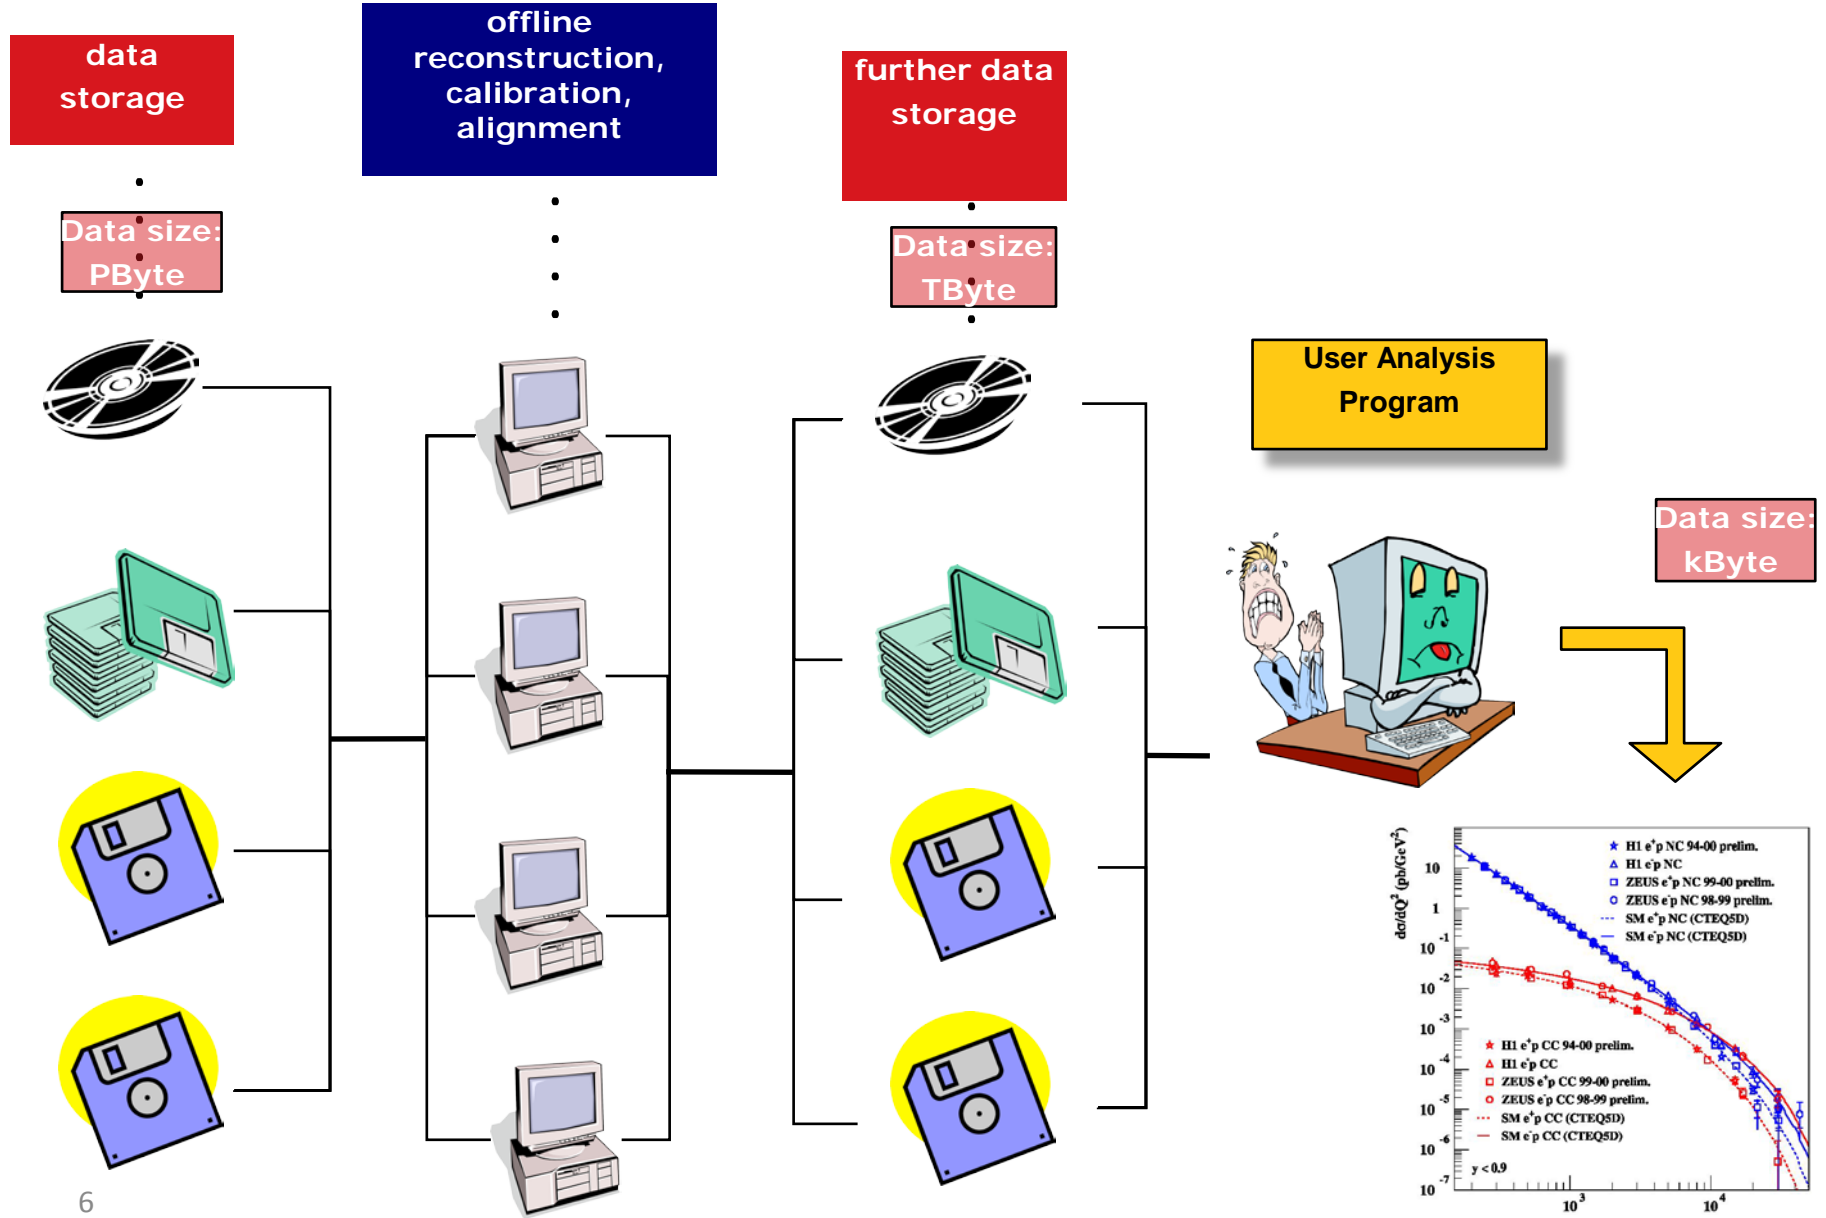

DAQ chain (see lectures by W. Vandelli & B. Dahmes)

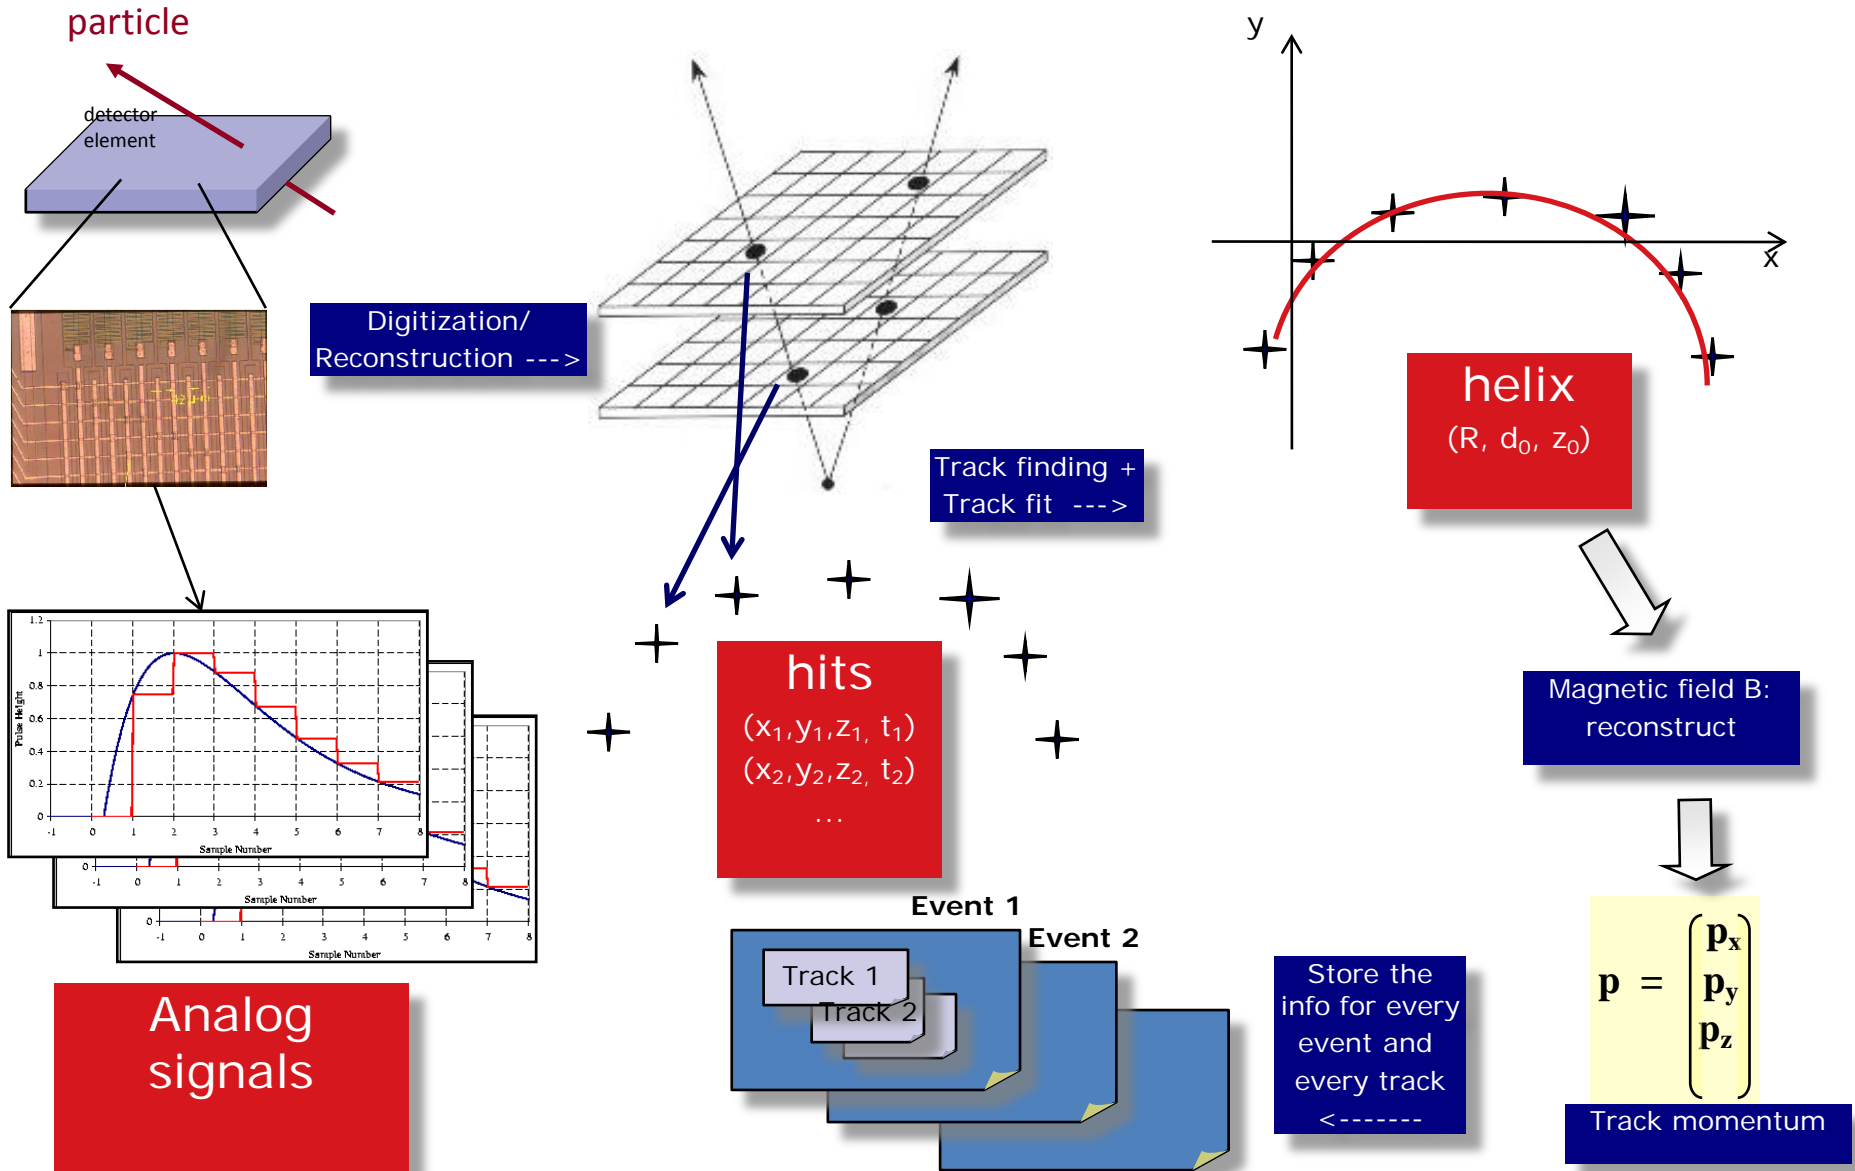

Offline Analysis Chain

Data reduction/abstraction

High Level Data Storage

- Data are stored sequentially in files...

Event 1

Nch (charged tracks) :
2

Pcha
(Momentum of each track):
{ {"-7.65698", "42.9725", "14.3404"},
{" 7.54101", "-42.1729", "-14.0108"} }

px py pz

Qcha
(Charge of each track):
{ -1, 1 }

Event 2

Nch (charged tracks) :
3

Pcha
(Momentum of each track):
{ {"-12.9305", "12.2713", "40.5615"},
{" 12.2469", "-11.606", "-38.7182"},
{"0.143435", "-0.143435", "-0.497444"} }

px py pz

Qcha
(Charge of each track):
{ -1, 1, -1 }

Simulation

process and
detector
simulation

data
storage

Simulation of many (millions) of events

• simulate physics process

e.g. $p p \rightarrow Z$
or $p p \rightarrow H$

• plus the detector response
to the produced particles

• understand detector response
and analysis parameters
(lost particles, resolution,
efficiencies, backgrounds)

• and compare to real data

• Note : simulations present
from beginning to end of
experiment, needed to make
design choices

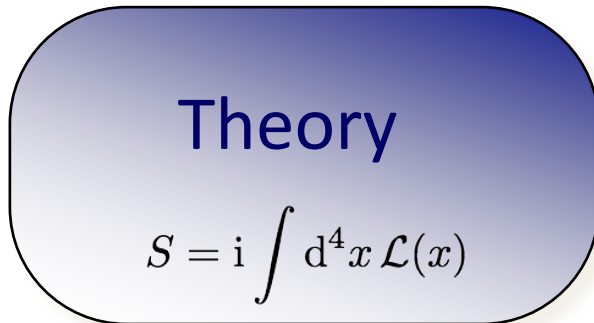

Our Task

We use experiments to inquire about what “reality” (nature) does

We intend to fill this gap

The goal is to understand in the most general; that's usually also the simplest.
- A. Eddington

Theory...

$$\begin{aligned}
 \mathcal{L} = & -\frac{1}{4} \mathbf{W}_{\mu\nu} \cdot \mathbf{W}^{\mu\nu} - \frac{1}{4} B_{\mu\nu} B^{\mu\nu} & \left\{ \begin{array}{l} W^\pm, Z, \gamma \text{ kinetic} \\ \text{energies and} \\ \text{self-interactions} \end{array} \right. \\
 & + \bar{L} \gamma^\mu (i\partial_\mu - g \frac{1}{2} \boldsymbol{\tau} \cdot \mathbf{W}_\mu - g' \frac{Y}{2} B_\mu) L & \left\{ \begin{array}{l} \text{lepton and quark} \\ \text{kinetic energies} \\ \text{and their} \\ \text{interactions with} \\ W^\pm, Z, \gamma \end{array} \right. \\
 & + \bar{R} \gamma^\mu (i\partial_\mu - g' \frac{Y}{2} B_\mu) R & \\
 & + \left| (i\partial_\mu - g \frac{1}{2} \boldsymbol{\tau} \cdot \mathbf{W}_\mu - g' \frac{Y}{2} B_\mu) \phi \right|^2 & \left\{ \begin{array}{l} W^\pm, Z, \gamma \text{ and} \\ \text{Higgs masses} \\ \text{and couplings} \end{array} \right. \\
 & - V(\phi) & \\
 & - (G_1 \bar{L} \phi R + G_2 \bar{L} \phi_c R + h.c.) & \left\{ \begin{array}{l} \text{lepton and quark} \\ \text{masses and} \\ \text{coupling to Higgs} \end{array} \right.
 \end{aligned}$$

L ... left-handed fermion (l or q) doublet
 R ... right-handed fermion singlet

\mathcal{L} from QCD:

$$\mathcal{L} = \underbrace{\bar{q} (i\gamma^\mu \partial_\mu - m) q}_{E_{\text{kin}}(q)} - g \underbrace{(\bar{q} \gamma^\mu T_a q) G_\mu^a}_{\text{Interaction } q, g} - \frac{1}{4} \underbrace{G_{\mu\nu}^a G_a^{\mu\nu}}_{E_{\text{kin}}(g)}$$
 includes self-interaction between gluons

eg.
the Standard Model

has parameters

coupling constants

masses

predicts:
cross sections,
branching ratios, lifetimes, ...

Experiment...

eg.

1/30th of an event in the BaBar detector

- get about 100 evts/sec

“Address” :

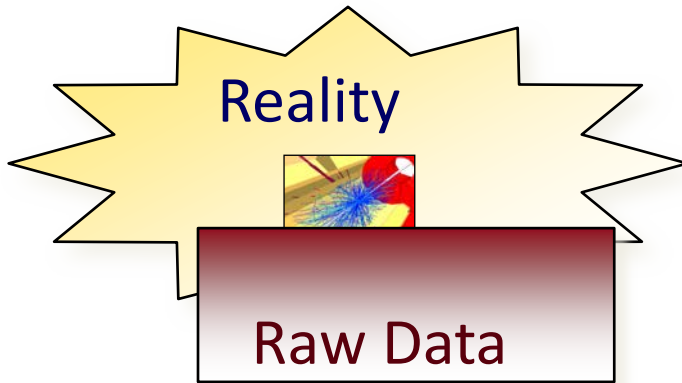

- which detector element took the reading

“Value(s)” :

- what the electronics wrote out

Making the connection

The imperfect measurement of a (set of) interactions in the detector

A unique happening:
eg. Run 23458, event 1345
which contains a $Z \rightarrow \mu^+ \mu^-$ decay

Analysis : We “confront theory with experiment” by comparing the measured quantity (observable) with the prediction.

cross sections (probabilities for interactions),
branching ratios (BR), ratios of BRs, specific
lifetimes, ...

A small number of general equations, with some
parameters (poorly or not known at all)

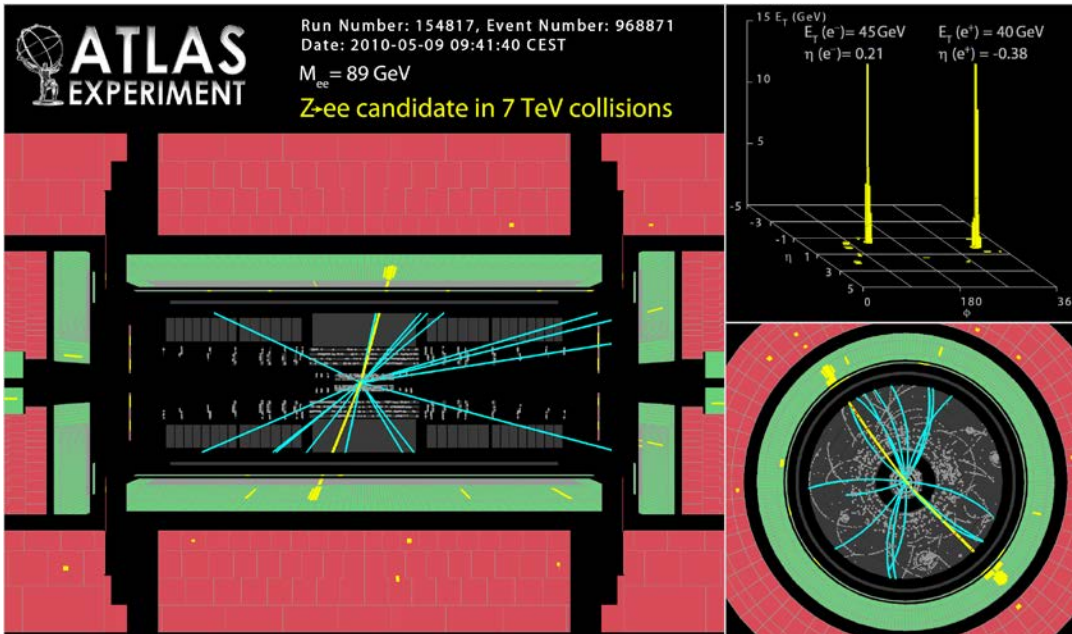

Section 2: A simple example

Measuring Z^0 cross-section at LHC

- Z^0 boson decays to lepton or quark pairs
 - We can reconstruct it in the e^+e^- or $\mu^+\mu^-$ decay modes
- Discovery and study of the Z^0 boson was a critical part of understanding the electroweak force
- Measuring the Z^0 cross-section at the LHC important test of theory
 - Does the measurement agree with the theoretical prediction at LHC collision energy?
- Now we use the Z^0 as a tool for studying electron and muon reconstruction and deriving calibrations (have now recorded millions of Z decays)

Z^0 cross-section is related to the probability that we will produce a Z^0 at the LHC

CMS Experiment at LHC, CERN
Run 136087 Event 39967482
Lumi section: 314
Mon May 24 2010, 15:31:58 CEST

Z- $\mu\mu$ event in CMS

Muon $p_T = 27.3, 20.5$ GeV/c
Inv. mass = 85.5 GeV/c²

Reconstructing Z^0 's

How do we know if it's a Z^0 :

Identify Z decays using the invariant mass of the 2 leptons

$$M^2 = (L_1 + L_2)^2 \quad \text{where } L_i = (E_i, \mathbf{p}_i) = 4\text{-vector for lepton } i$$

Under assumption that lepton is massless compared to mass of Z^0

$$\Rightarrow M^2 = 2 E_1 E_2 (1 - \cos\vartheta_{12}) \quad \text{where } \vartheta_{12} = \text{angle between the leptons}$$

So need to reconstruct the electron and muon energy and direction.
Then can calculate the mass.

Select Z^0 events with 'analysis cuts':

- Events with 2 high momentum electrons or muons
- Require the electrons or muons are of opposite charge
- With di-lepton mass close to the Z^0 mass (e.g. $70 < m_{l+l-} < 110$ GeV)

Very little background in the Z^0 mass region

UA1: observation of $Z \rightarrow e^+ e^-$

(May 1983)

The Nobel Prize in Physics 1984
Carlo Rubbia, Simon van der Meer

Two energy clusters ($p_T > 25 \text{ GeV}$)
in electromagnetic calorimeters;
energy leakage in hadronic calorimeters
consistent with electrons

Isolated track with $p_T > 7 \text{ GeV}$
pointing to at least one cluster

Isolated track with $p_T > 7 \text{ GeV}$
pointing to both clusters

Measuring the Z^0 cross-section

Theoretically:

Cross-section calculated for:

- Specific production mechanism (pp, $p\bar{p}$, e^+e^-)
- Centre-of-Mass of the collisions (7TeV at LHC)

Experimentally:

$$\sigma(pp \rightarrow Z) = (N_{\text{OBS}} - N_{\text{BKG}}) / L \epsilon$$

Where:

N_{OBS} = Number of observed events passing the selection

N_{BKG} = Estimate of the number of background events

L = Luminosity of the data samples (amount of data)

ϵ = Efficiency of the selection on Z^0 events

(how often would we select a true Z^0 event with our selection?)

Can use simulated data to evaluate ϵ and N_{BKG}

Measuring the Z^0 cross-section

$$\sigma(pp \rightarrow Z) = (N_{OBS} - N_{BKG}) / L \epsilon$$

Looks like simple counting experiment.

But need to also calculate **uncertainty** on the cross-section – measurement without an uncertainty is useless.

Two components to the uncertainty:

Statistical: $\sim \sqrt{N_{OBS}}$

Systematic:

- How well do we know the background?
- How well do we know the efficiency?
- How well do we know the luminosity?

Most of the work in the physics analysis is trying to understand the systematic uncertainties related to the above questions.

Electron and Muon channel agree within uncertainties

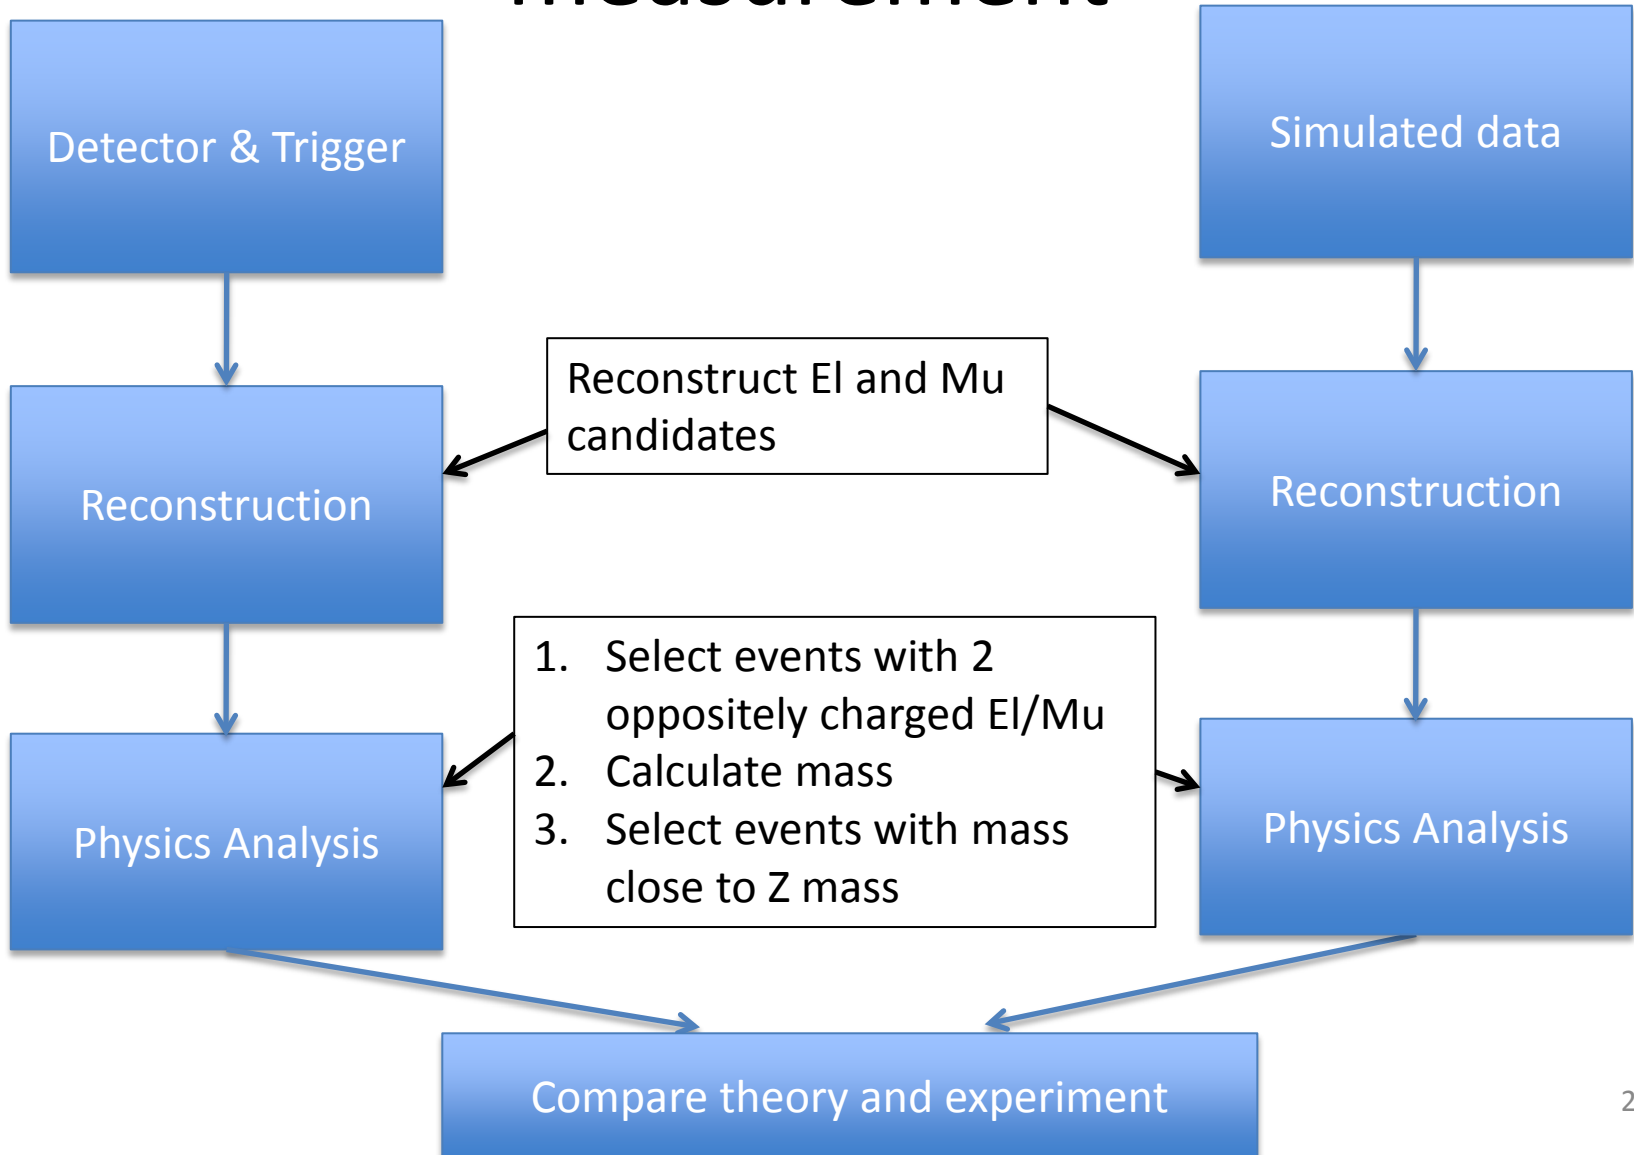

Theory prediction

Measurement consistent with prediction within uncertainties

Measurements of the Z cross-section were one of the first physics measurements from ATLAS and CMS.

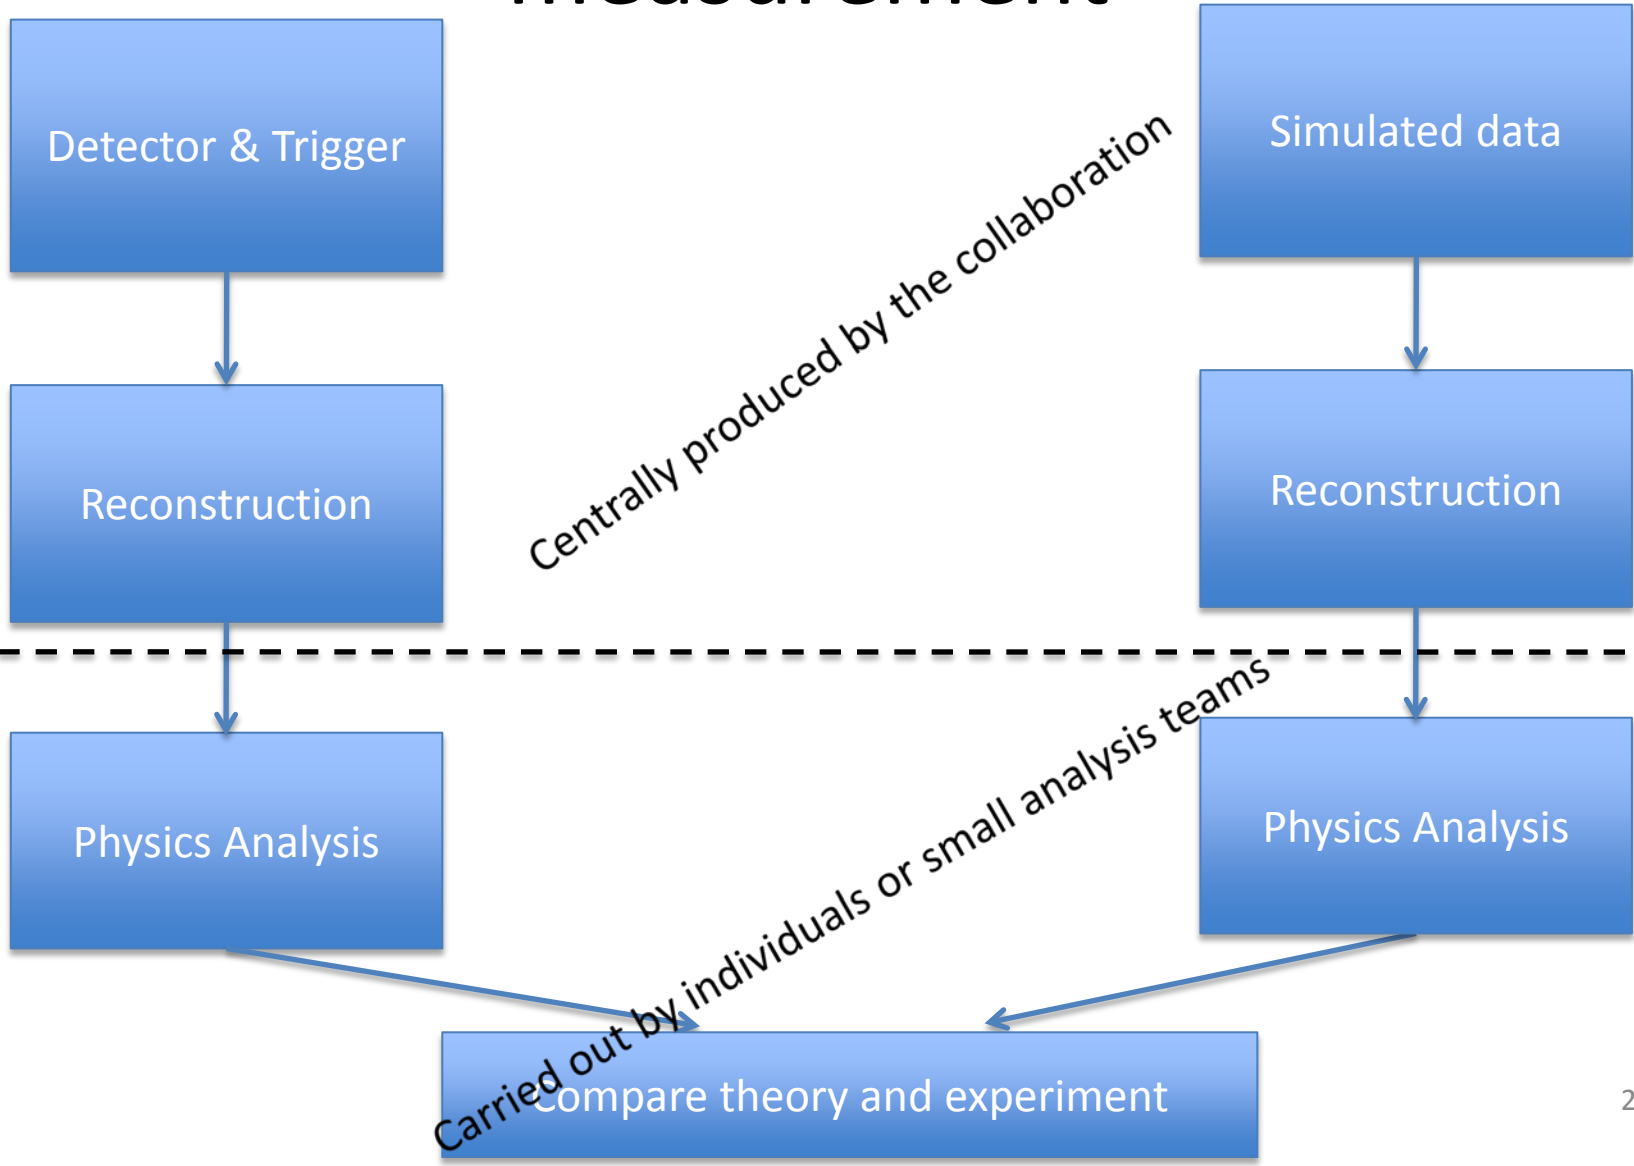

Analysis flow in Z cross-section measurement

Analysis flow in Z cross-section measurement

Summary

- Path from Raw data to physics results contains many steps
 - Online path (Trigger and DAQ)
 - Offline path
 - Reconstruction
 - Physics Analysis
 - Use simulation in order to compare data with theoretical predictions
 - Above points illustrated with the example of the Z^0 cross-section measurement at the LHC
 - More details tomorrow

Section 3: Reconstruction

Reconstruction

- Detector reconstruction
 - Tracking
 - finding path of charged particles through the detector
 - Calorimeter reconstruction
 - finding energy deposits in calorimeters from charged and neutral particles
- Combined reconstruction
 - Electron/Photon identification
 - Muon identification
 - Jet finding
- Calibrations and alignments applied at nearly every step

Important figures of merit for reconstructed objects

- **Efficiency**
 - how often do we reconstruct the object – e.g. tracking efficiency

$$\text{Efficiency} = (\text{Number of Reconstructed Tracks}) / (\text{Number of True Tracks})$$

Important figures of merit for reconstructed objects

- **Efficiency**

- how often do we reconstruct the object – e.g. tracking efficiency

- **Resolution**

- how accurately do we reconstruct it – e.g. energy resolution

Electron energy resolution from simulation

$$\text{Energy resolution} = (\text{Measured_Energy} - \text{True_Energy}) / \text{True_Energy}$$

Important figures of merit for reconstructed objects

- **Efficiency**
 - how often do we reconstruct the object – e.g. tracking efficiency
- **Resolution**
 - how accurately do we reconstruct a quantity – e.g. energy resolution
- **Fake rate**
 - how often we reconstruct a different object as the object we are interested in – e.g. a jet faking an electron

$$\text{Fake rate} = (\text{Number of jets reconstructed as an electron}) / (\text{Number of jets})$$

Important figures of merit for reconstructed objects

- **Efficiency**
 - how often do we reconstruct the object – e.g. tracking efficiency
- **Resolution**
 - how accurately do we reconstruct a quantity – e.g. energy resolution
- **Fake rate**
 - how often we reconstruct a different object as the object we are interested in – e.g. a jet faking an electron

These quantities depend on the detector, but also on the reconstruction and calibrations and alignment!

Important figures of merit for reconstructed objects

- **Efficiency**
 - how often do we reconstruct the object – e.g. tracking efficiency
- **Resolution**
 - how accurately do we reconstruct a quantity – e.g. energy resolution
- **Fake rate**
 - how often we reconstruct a different object as the object we are interested in – e.g. a jet faking an electron

For physics analysis it is important

- to have high efficiency, good resolution, and low fake rates
- to be able to measure the efficiencies, resolutions and fake rates and their uncertainties (not easy)

Reconstruction Goals

- High efficiency
- Good resolution
- Low fake rate
- Robust against detector problems
 - Noise
 - Dead regions of the detector
- Be able to run within the computing resources limitations
 - CPU time per event
 - Memory use
