# Introduction

- Introduction to  $\mu$ -PIC
- Design of new  $M^3$ -PIC
- Advantages using micro mesh

# Introduction to $\mu$ -PIC

➔  $M^3$ -PIC is based on  $\mu$ -PIC

- $\mu$ -PIC : micro pixel gas chamber
- Large area with PCB tech.
- pitch :400 $\mu$ m
- high gas gain
- small discharge damage

	MSGC	$\mu$ -PIC
Maximum gain	1700(with capillary)	15000
Stable Gain	1000	7000
Long time		>30 days
Area	10 × 10cm <sup>2</sup>	30 × 30cm <sup>2</sup>
Pitch	200 $\mu$ m	400 $\mu$ m (300 $\mu$ m possible)
uniformity ( $\sigma$ )	~35%	4%

- Invented by A.Ochi and T.Tanimori ( NIMA 471 (2001) 264)
- Application: X-ray imaging, Gamma camera, Medical RI tracing, etc.

# Introduction to $\mu$ -PIC (cont'd)

- ▶ Applications --- Micro TPC  $\rightarrow$  Gamma ray camera

(ETCC: Electron-Tracking Compton Camera)

**X, Y from m-PIC**  
+  
**Z from timing**

**3 D Track**

**Gaseous TPC**  
with micro-electrodes

**Recoil Electron :**  
3D Sequential Track  $\rightarrow$  Direction,  
Energy

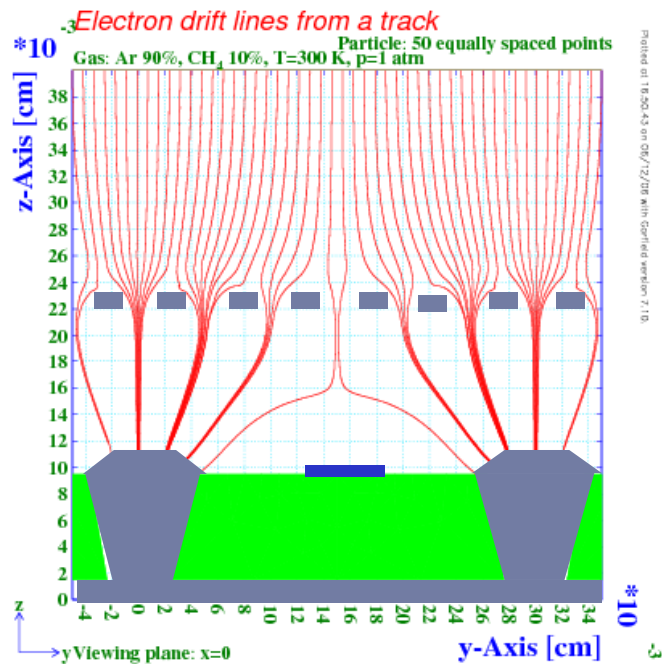

**Scintillation Camera**

Less cost than semiconductor  
Scattered Gamma-ray :  
Energy, Direction

$$\cos \alpha = \left( 1 - \frac{m_e c^2}{E_g} \right) \sqrt{\frac{K_e}{K_e + 2m_e c^2}}$$

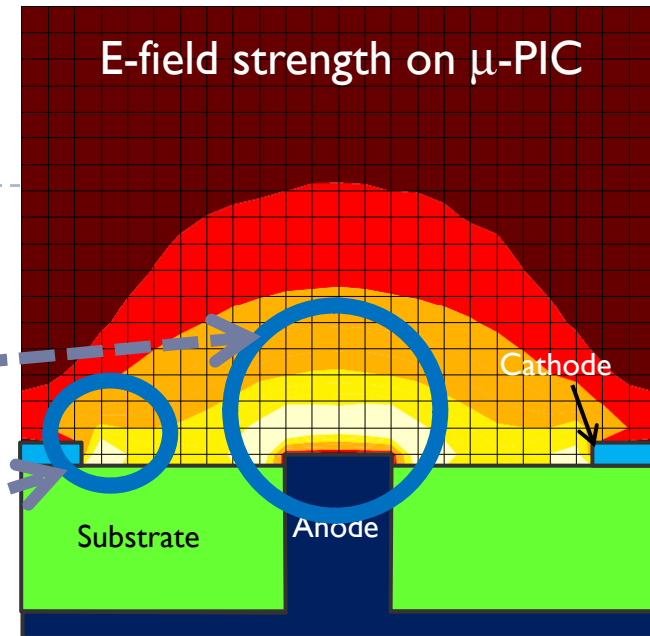

# Design of M<sup>3</sup>-PIC

- ▶ Micro pixel chamber ( $\mu$ -PIC)
  - +
    - ▶ With micro mesh
      - ▶ Higher gain in stable operation ( $\sim 5 \times 10^4$ )
      - ▶ Low ion backflow ( $< 1\%$ )

# Advantages using micro mesh

- ▶ Higher gas gain will be attained **safely** ( $10^{4-5}$ )
  - ▶ High electric field is formed larger area around the anode
  - ▶ Without increase of e-field near cathode edge
    - ▶ Electron emission from cathode edge is reduced
    - ▶ Streamer from anode is quenched
- ▶ Reduction of positive ion backflow
  - ▶  $\mu$ -PIC:  $\sim 30\%$
  - ▶  $M^3$ -PIC:  $< 1\%$

---

# Setup and operation tests

- Setup
- Gas gain measurements
- Ion backflow measurements

# Setup

Micro mesh mounted on  $\mu$ -PIC by hand.  
Size of  $\mu$ -PIC = 3cm x 3cm.

Micro scope pictures  
for same place  
(different focus point)

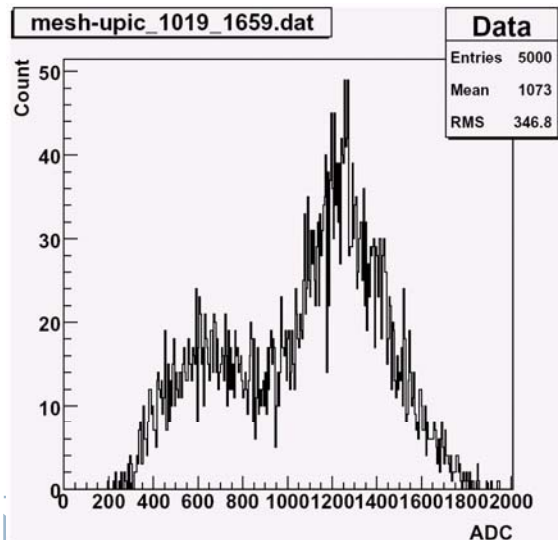

← 0.5mm →

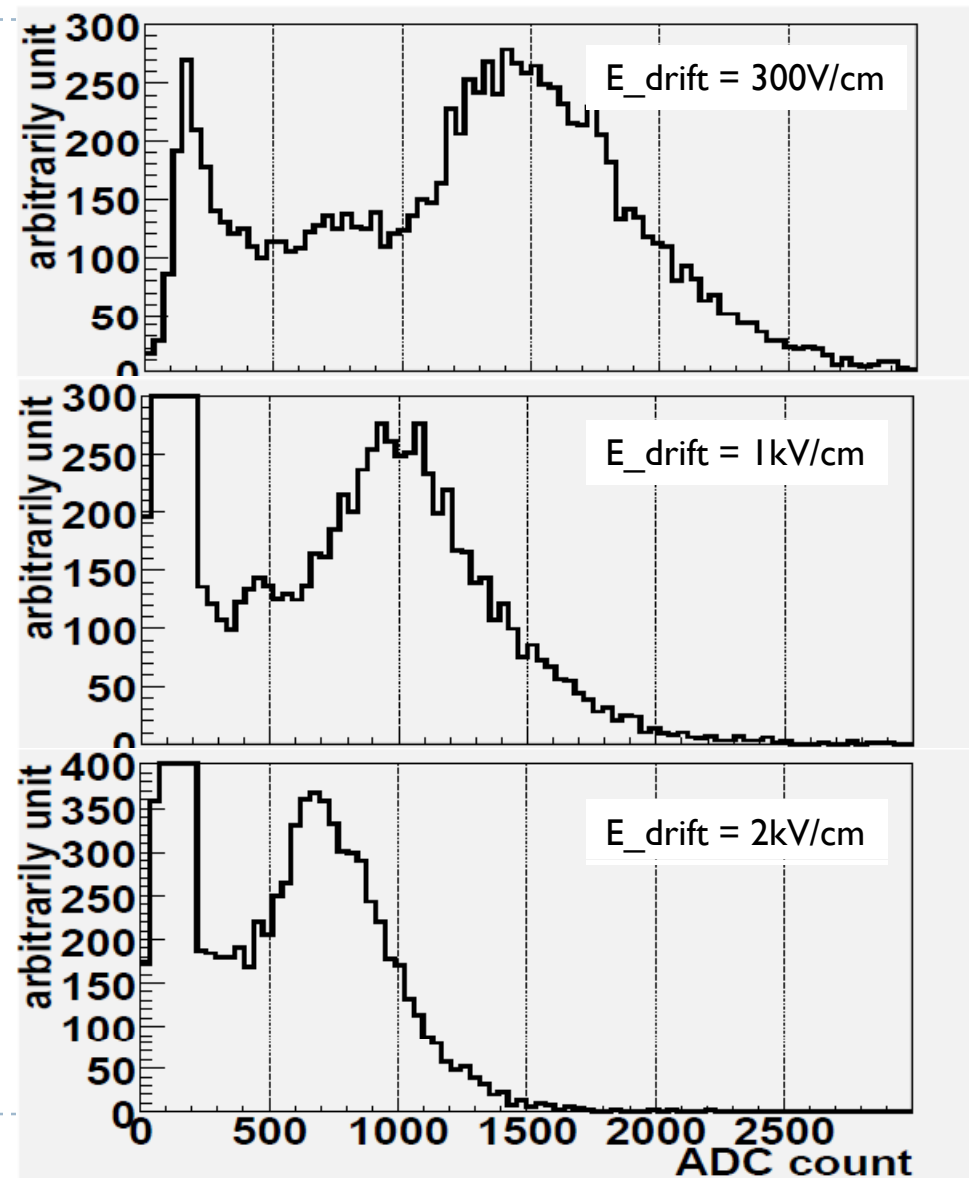

# Gas gain measurements

- ▶ Gain dependency on
  - ▶ Anode voltage ( $=V_a$ )
  - ▶ Mesh voltage ( $=V_m$ )
  - ▶ Drift field ( $=(V_d - V_m) / 1\text{cm}$ )

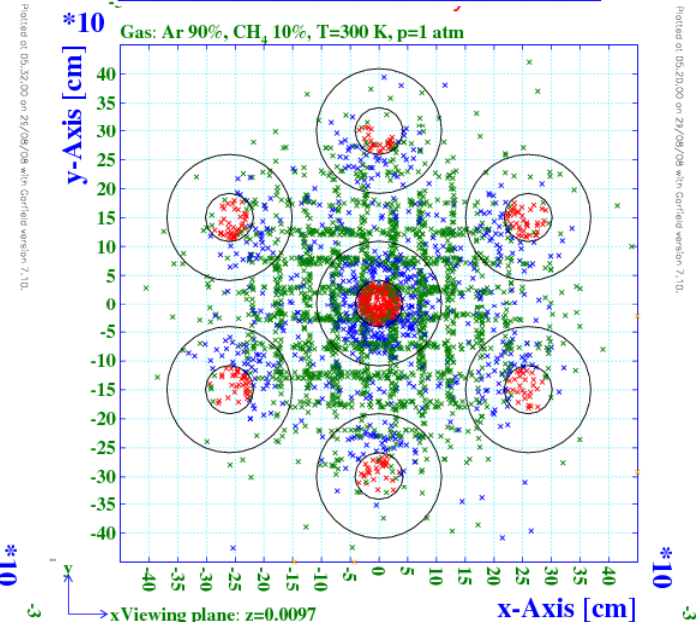

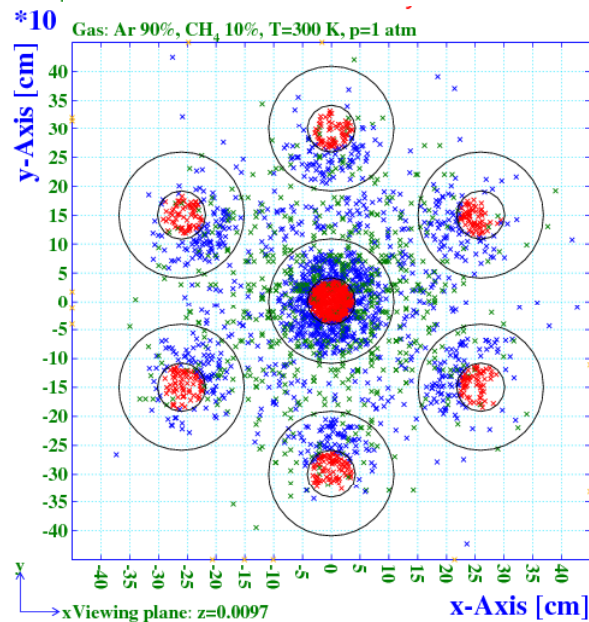

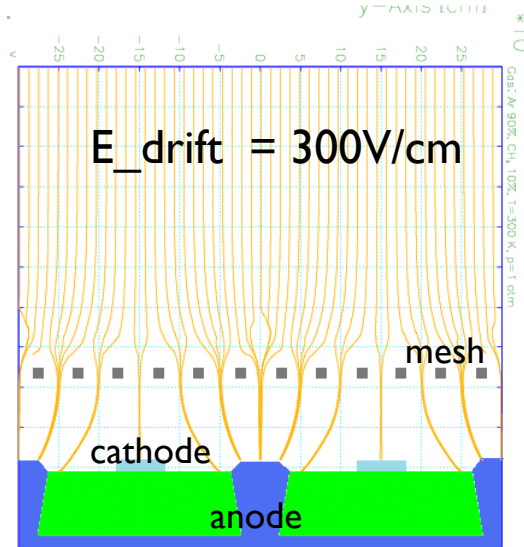

# Gain dependence of drift field

- ▶ Higher drift field
  - ▶ Lower electron collection efficiency on anode
  - Gain decrease
  - Energy resolution worse
    - No escape peak found in 2kV/cm
- ▶ Maximum gain
  - ▶  $100\text{V/cm} < E_d < 500\text{V/cm}$
  - ▶  $E_d$  below 100V/cm
    - Ion-electron recombination

# Electron drifts toward anode (simulation)

- ▶ Electrons are absorbed in the mesh or cathodes when electric field in drift region is higher.

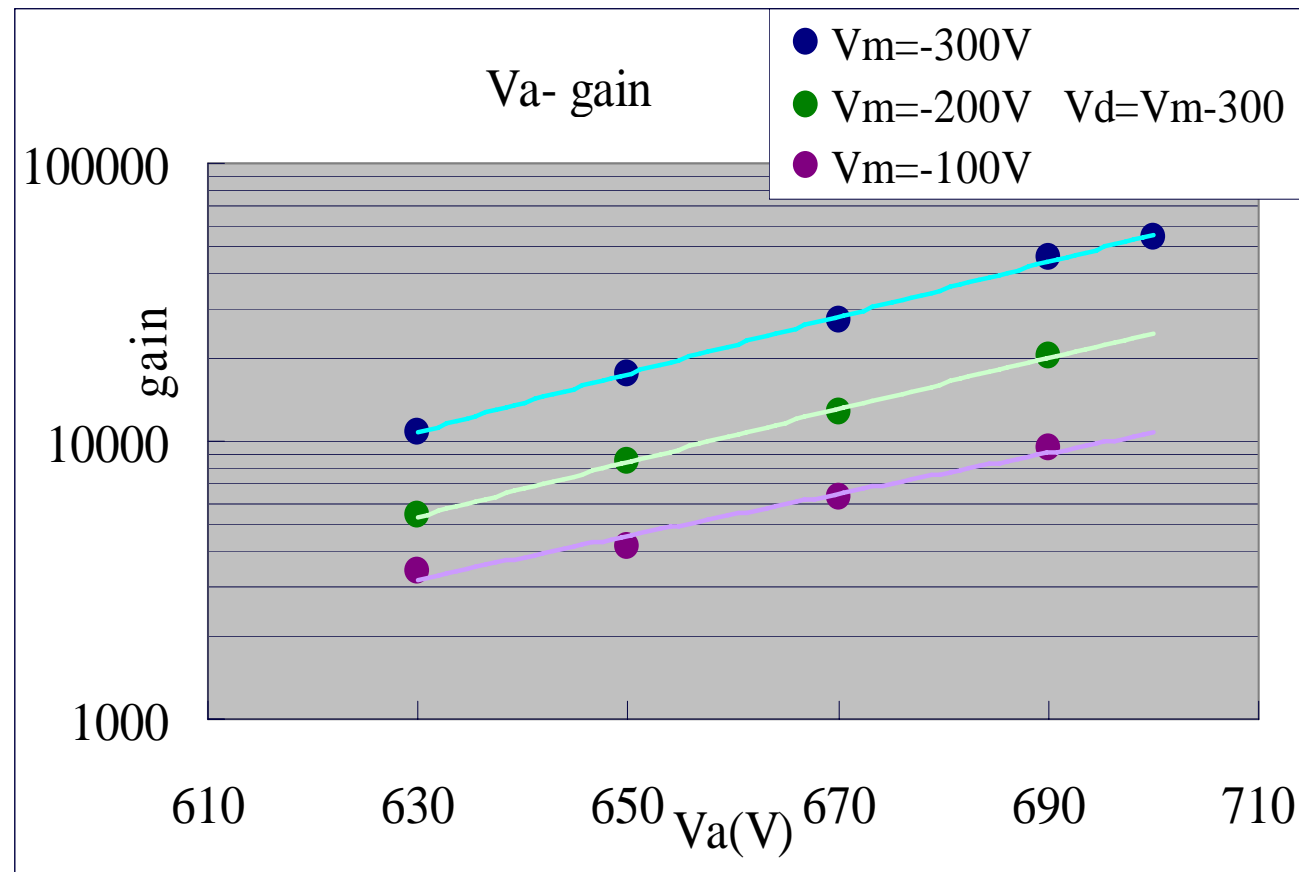

Printed at 05:32:00 on 24/08/08 with Giffile version 7.10.

# Gain dependence on $V_m$ and $V_a$

- ▶  $E_{\text{drift}} = 300\text{V/cm}$
- ▶ **Maximum gain :  $5 \times 10^4$**

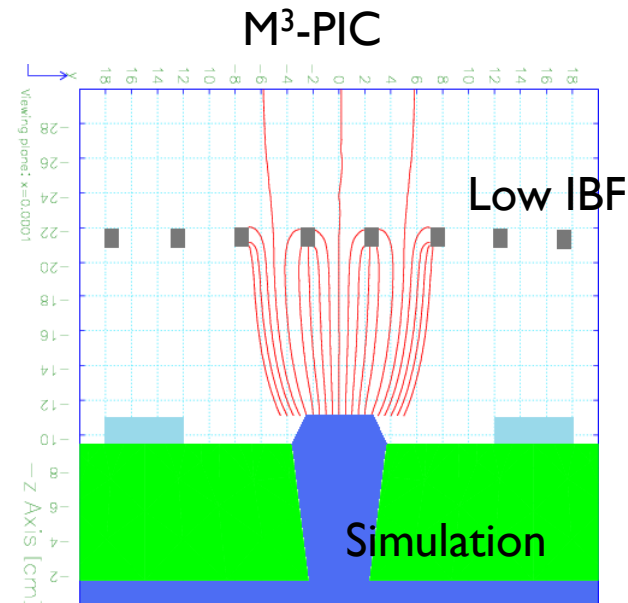

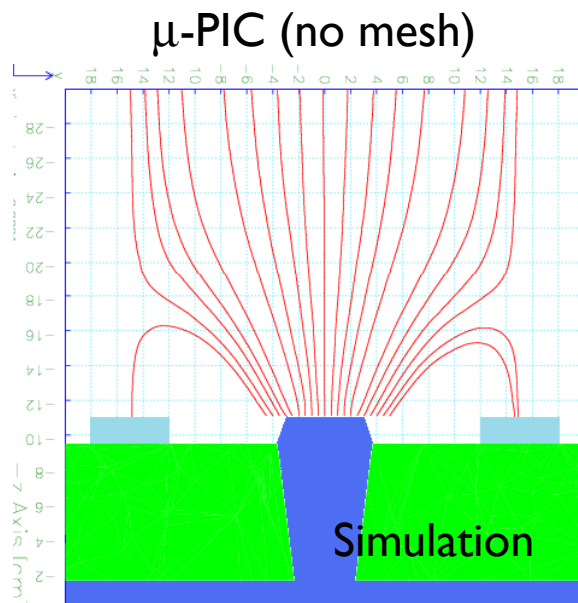

Gap of mesh:  $165\mu\text{m}$   
Mesh thickness:  $5\mu\text{m}$   
Gas: Ar:C<sub>2</sub>H<sub>6</sub> = 50:50

# Ion backflow (IBF)

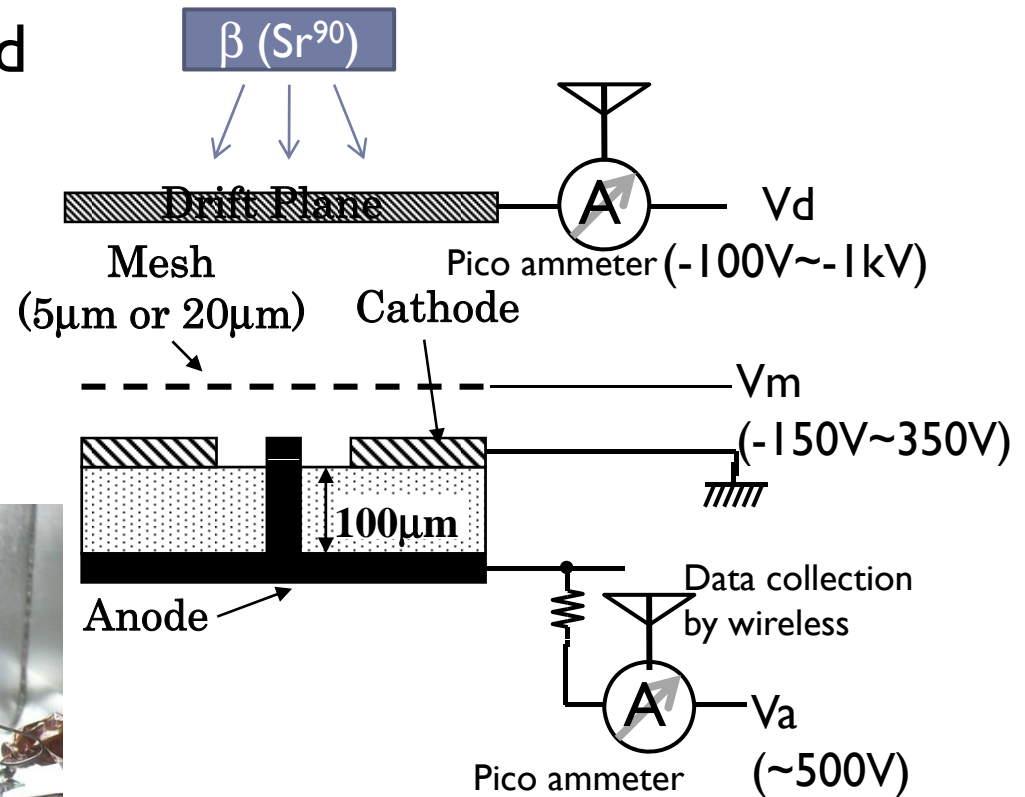

- ▶ Ion backflow: The fraction of total avalanche-generated ions reaching to drift region.
- ▶ Serious problem for TPC readout

Ion drift lines from anodes

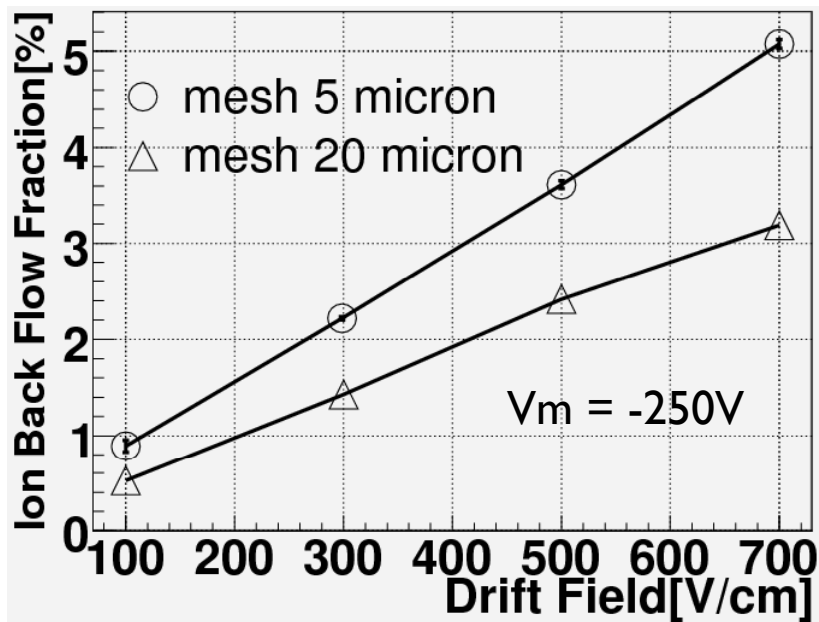

# Setup for ion backflow measurements

- ▶ Pico-ammeter is inserted in Drift and Anode line
- ▶  $IBF = (I_{drift}/I_{anode})$
- ▶ Wireless data taking for keeping insulation

# IBF of M<sup>3</sup>-PIC

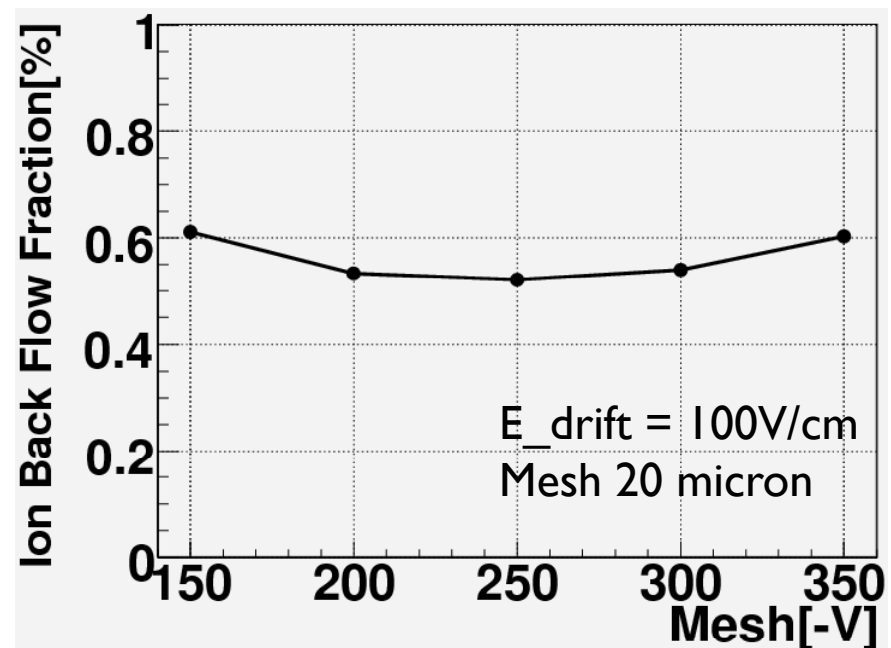

- ▶ IBF dependence on drift field and mesh thickness

- Gas: Ar 90% + C<sub>2</sub>H<sub>6</sub> 10%
- Gain = 10<sup>4</sup> for these tests
- Linear dependence of IBF on drift field
- Small IBF for thicker mesh

- ▶ ➤ Optimum point of mesh voltage

- ▶ IBF dependence on mesh voltage

**Minimum IBF = 0.5%**

# Summary

---

- ▶ New MPGD design: M<sup>3</sup>-PIC was developed
  - ▶ Combined with  $\mu$ -PIC and micro mesh
  - ▶ Ideal electrical fields are formed around anodes for gas avalanche
- ▶ Prototype was manufactured and tested
- ▶ Maximum **gain of  $5 \times 10^4$**  has been attained at present
  - ▶ A few time larger than the gain of simple  $\mu$ -PIC
- ▶ Minimum **IBF of 0.5%** has been attained at present

## Future Prospects

- ▶ Optimization of structure parameters (mesh gap, mesh thickness ... etc.) and operation parameters (HV, gas etc.)
- ▶ Combination with existence large area  $\mu$ -PIC
  - ▶ Testing imaging and tracking capabilities
  - ▶ Long term operation test
