# Worker Node security discussion
Pre-GDB day

Security controls

Assuming that gLexec (or similar) is deployed, this session is discussing the implementation of security controls (e.g. blocking/banning end users, credential revocation) and who should operate them.

- What should be our model of banning blocking?
- Role of Argus? Deployment plan?
- Multiple Role of authentication/CAs and CRLs?
- Role of the VOs and sites in incident handling?
