Excited QCD 2013

Sunday 03 February 2013 - Saturday 09 February 2013
Bjelasnica Mountain, Sarajevo

Book of Abstracts
## Contents

- A First Estimate of Triply Heavy Baryon Masses from the pNRQCD Perturbative Static Potential ................................................................. 1
- Calculating the analytic structure of QFT Green’s functions on GPUs ............................................................................................................. 1
- Center Symmetry and Confinement ......................................................................................................................................................... 1
- Development of the Bonn-Gatchina partial wave analysis method and search for parity partners .......................................................... 1
- Differentiating between $\Delta$ and Y-string confinement: Can one see the difference in baryon spectra? ................................................................. 1
- Dilepton production in pion-nucleon collision ........................................................................................................................................ 1
- Eta’ multiplicity and the Witten-Veneziano relation at finite temperature .................................................................................................. 1
- Event-by-event fluctuations and the correlation between early and late emitted particles ..................................................................... 2
- Excited Hadrons, Heavy Quarks and QCD thermodynamics ..................................................................................................................... 2
- Flow in p-Pb collisions at the LHC ......................................................................................................................................................... 2
- From field theory to superfluid hydrodynamics of dense quark matter ..................................................................................................... 2
- Future plans an perspectives for hadronic physics at the INFN Frascati National Laboratory ................................................................. 2
- Gauge Fixing in Lattice QCD on Multi-GPUs ........................................................................................................................................ 2
- Geometrical scaling in high energy collisions and its breaking .................................................................................................................. 2
- Glueballs in the Bethe-Salpeter Formalism ........................................................................................................................................ 2
- Hadron Production in ISR and 2-photon annihilations at BABAR ............................................................................................................. 3
- Hadron resonances from lattice QCD ..................................................................................................................................................... 3
- Hadronic contributions to the muon $g-2$ ............................................................................................................................................... 3
- Heavy Ion Jets Measured by ATLAS ................................................................................................................................................. 3
- Inverse Magnetic Catalysis in dense matter ....................................................................................................................................... 3
- Latest QCD results from the ALICE experiment ................................................................................................................................. 3
Latest QCD results on Pb-Pb collisions from CMS
Latest QCD results on p+p collisions from CMS
Lattice QCD based equation of state at finite baryon density
Light Hadron Physics at KLOE and KLOE-2
Light quark masses in multi-quark interactions
Low mass scalar mesons in a simple effective model
Meson Spectroscopy at CLAS12
Meson vacuum phenomenology in a three-flavor linear sigma model with (axial-)vector mesons
Mesonic correlations in non-local NJL - status report
Mesons in a Bethe-Salpeter approach in Rainbow-Ladder
Nucleon excited states
Odd parity dynamically generated baryon resonances with heavy flavor
Opening Remarks
Overview of physics at FAIR
Particle Production at HERA
Phenomenology of the Scalar-Isoscalar Resonances \( f_0(1370), f_0(1500) \) and \( f_0(1710) \)
Precision tests of QCD at HERA
Properties and composition of the \( f_0(500) \) resonance
QCD with two light dynamical Chirally Improved quarks
QCD-like theories under extreme conditions
Quantifying initial state fluctuations in heavy ion collisions
Quarkonia suppression in quark-gluon plasma
Recent results on \( \Upsilon(5S) \) decays at Belle
Restoration of axial symmetry at finite temperature and its connection with restoration of chiral symmetry and deconfinement
Scalar mesons and tetraquarks from twisted mass lattice QCD
Scalar mesons, pipi D-wave fotoproduction and threshold parameters - all from the Roy like dispersion relations
Simulation of Gauge-Higgs models using the worm algorithm ........................ 7
Strange and charm meson masses from twisted mass lattice QCD .................. 7
Study of tetraquark system from meson-meson scattering with a color flip-flop model .... 7
Study of the $K^+K^-$ final state interaction in proton – proton and electron – positron collisions ................................................................. 8
Tensor meson photoproduction on proton through the final state meson-meson interactions ................................................................. 8
The NICA project at JINR, Dubna ................................................................. 8
The role of the quark-gluon vertex in the QCD phase transition ...................... 8
The search for glueballs and hybrids .......................................................... 8
$f_0(1370)$ and spectroscopy with glueballs ................................................ 8
A First Estimate of Triply Heavy Baryon Masses from the pN-RQCD Perturbative Static Potential

Calculating the analytic structure of QFT Green’s functions on GPUs

Center Symmetry and Confinement

Development of the Bonn-Gatchina partial wave analysis method and search for parity partners

Differentiating between Δ and Y-string confinement: Can one see the difference in baryon spectra?

Dilepton production in pion-nucleon collision

Eta’ multiplicity and the Witten-Veneziano relation at finite temperature
Event-by-event fluctuations and the correlation between early and late emitted particles

Excited Hadrons, Heavy Quarks and QCD thermodynamics

Flow in p-Pb collisions at the LHC

From field theory to superfluid hydrodynamics of dense quark matter

Future plans an perspectives for hadronic physics at the INFN Frascati National Laboratory

Gauge Fixing in Lattice QCD on Multi-GPUs

Geometrical scaling in high energy collisions and its breaking
Glueballs in the Bethe-Salpeter Formalism

Hadron Production in ISR and 2-photon annihilations at BABAR

Hadron resonances from lattice QCD

Hadronic contributions to the muon g-2

Heavy Ion Jets Measured by ATLAS

Inverse Magnetic Catalysis in dense matter

Latest QCD results from the ALICE experiment
Latest QCD results on Pb-Pb collisions from CMS

77

Latest QCD results on p+p collisions from CMS

75

Lattice QCD based equation of state at finite baryon density

60

Light Hadron Physics at KLOE and KLOE-2

62

Light quark masses in multi-quark interactions

90

Low mass scalar mesons in a simple effective model

64

Meson Spectroscopy at CLAS12

83

Meson vacuum phenomenology in a three-flavor linear sigma model with (axial-)vector mesons
103

Mesonic correlations in non-local NJL - status report

69

Mesons in a Bethe-Salpeter approach in Rainbow-Ladder

107

Nucleon excited states

108

Odd parity dynamically generated baryon resonances with heavy flavor

117

Opening Remarks

114

Overview of physics at FAIR

74

Particle Production at HERA
Phenomenology of the Scalar-Isoscalar Resonances $f_0(1370)$, $f_0(1500)$ and $f_0(1710)$

110

Precision tests of QCD at HERA

59

Properties and composition of the $f_0(500)$ resonance

Jose R. Pelaez

88

QCD with two light dynamical Chirally Improved quarks

101

QCD-like theories under extreme conditions

100

QCD-like theories under extreme conditions

71

Quantifying initial state fluctuations in heavy ion collisions

87

Quarkonia suppression in quark-gluon plasma

112

Recent results on $\Upsilon(5S)$ decays at Belle
Scalar mesons and tetraquarks from twisted mass lattice QCD

We study the light scalar mesons $a_0(980)$ and $\kappa$ using $N_f = 2+1+1$ flavor twisted mass lattice QCD. In order to probe the internal structure of these scalar mesons, and in particular to identify, whether a sizeable tetraquark component is present, we use a large set of operators, including diquark-antidiquark, mesonic molecule and two-meson operators. We find that the low-lying states overlap essentially exclusively with two-meson states. This indicates that in the channels investigated no tightly bound four quark states of either molecular or diquark-antidiquark type exist.

Scalar mesons, pipi D-wave fotoproduction and threshold parameters - all from the Roy like dispersion relations

Simulation of Gauge-Higgs models using the worm algorithm

Strange and charm meson masses from twisted mass lattice QCD
Study of tetraquark system from meson-meson scattering with a color flip-flop model

61

Study of the $K^+ K^-$ final state interaction in proton – proton and electron – positron collisions

80

Tensor meson photoproduction on proton through the final state meson-meson interactions

65

The NICA project at JINR, Dubna

97

The role of the quark-gluon vertex in the QCD phase transition

66

The search for glueballs and hybrids

81

f0(1370) and spectroscopy with glueballs
