

SAM JobWrapper tests status update

Piotr Nyczyk

30 July 2007

- Instructions on how to disable R-GMA based JobWrapper tests were published long time ago
 - several manual steps to be done on WNs
- However, the current gLite release still contain them, so:
 - all WNs installed from scratch will have them enabled by default
 - Site admin has to apply the procedure after the installation
 - It shouldn't be the case for upgraded WNs

- Uses SAM/GridView publishing web service as the only transport layer
 - It uses HTTP connection
 - can be proxied by using HTTP_PROXY variable
- R-GMA related code was completely removed
- Target: maximum execution time ~30s
- Submitted as a patch to gLite release team, however:
 - YAIM configuration function has to be written
 - has to be carefully tested on CTB and PPS
 - additional development iteration may occur if maximum execution time target not met
