# Rare Decays @ LHCb

#### Giampiero Mancinelli

CPPM - Aix-Marseille Université, France On behalf of the LHCb Collaboration

Rencontres du Vietnam Quy Nhon, Vietnam July 15-21, 2012

## WHAT THIS TALK IS NOT ABOUT

#### Well, almost ...

Introduction  $B \to \mu \mu$   $D \to \mu \mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0} \mu^+ \mu^- B \to K^{(*)} \mu^+ \mu^- B \to \pi \mu \mu B \to K^* \gamma$  Conclusions

## **OUTLINE**

- Rare leptonic decays ►
  - $B^0_{(s)} \rightarrow \mu^+ \mu^-$ [PRL 108, 231801 (2012)]
  - $D^0 \rightarrow \mu^+ \mu^-$ [LHCb-CONF-2012-005]
  - $\tau \to \mu \mu \mu$  [LHCb-CONF-2012-015]  $B^0_{(s)} \to \mu^+ \mu^- \mu^+ \mu^-$  [LHCb-CONF-2012-010]
- Rare semi-leptonic decays ►

• 
$$B^0 \rightarrow K^{*0}\mu^+\mu^-$$
 (angular analysis) [LHCb-CONF-2012-008]  
•  $B \rightarrow K^{(*)}\mu^+\mu^-$  (isospin asymmetry) [arXiv:1205.3422]  
•  $B^+ \rightarrow \pi^+\mu^+\mu^-$  [LHCb-CONF-2012-006]

Rare radiative decays ►

> •  $B^0 \to K^{*0} \gamma$  (CP asymmetry) [LHCb-CONF-2012-004]

#### All results obtained with $\sim 1 \, fb^{-1}$

## INTRODUCTION

#### Flavor Changing Neutral Currents

► FCNC processes prohibited at tree level within SM.

$$b \to sf\bar{f}$$
  
 $(b \to df\bar{f})$ 

- Measure effect of possible new particles entering (for instance) the loop:
  - branching fractions (B),
  - angular distributions,
  - asymmetries (CP, isospin).
- Complementary approach to direct searches (ATLAS/CMS).

#### $\textbf{Introduction} \quad B \to \mu \mu \quad D \to \mu \mu \quad \tau \to 3 \mu \quad B \to 4 \mu \quad B^0 \to K^{*0} \mu^+ \mu^- \quad B \to K^{(*)} \mu^+ \mu^- \quad B \to \pi \mu \mu \quad B \to K^* \gamma \quad \text{Conclusions}$

## INTRODUCTION

#### Muon and Hadron ID

good muon identification

• 
$$\epsilon(\mu) > 97\%(p_T > 1.7 \, GeV)$$

#### Muon Trigger

good muon trigger efficiency

good K- $\pi$  separation

 Low trigger p<sub>T</sub> thresholds for muons (0.5 GeV for di-muons)

Giampiero Mancinelli

 $\textbf{Introduction} \quad B \to \mu \mu \quad D \to \mu \mu \quad \tau \to 3 \mu \quad B \to 4 \mu \quad B^0 \to K^{*0} \mu^+ \mu^- \quad B \to K^{(*)} \mu^+ \mu^- \quad B \to \pi \mu \mu \quad B \to K^* \gamma \quad \text{Conclusions}$ 

## INTRODUCTION

#### B (D) Selection Criteria

- Decay vertex displaced from PV, large track impact parameter with respect to PV
- Quality of decay vertex and tracks
- B(D) meson candidate required to come from a PV
- Low systematics, fairly clean environment for a hadronic machine

#### B Measurements Strategy

- Normalize  $\mathcal{B}$  to modes with similar trigger and geometrical features;  $\frac{\mathcal{B}(signal)}{\mathcal{B}_{norm}} = \frac{\epsilon_{norm}}{\epsilon_{signal}} \times \frac{N_{signal}}{N_{norm}}$
- When necessary use the LHCb measured  $f_s/f_d$  value  $(0.267^{+0.021}_{-0.020})$ LHCb-CONF-2011-034
- Use control channels to avoid using simulation (ie. to calibrate multivariate classifiers, evaluate trigger efficiencies, etc)
- 'Blind' analysis to avoid biases
- CL<sub>s</sub> method [A. Read, J. Phys. G28 (2002)] to extract limits

$$\text{Introduction} \quad \textbf{B} \rightarrow \mu\mu \quad D \rightarrow \mu\mu \quad \tau \rightarrow 3\mu \quad \textbf{B} \rightarrow 4\mu \quad \textbf{B}^0 \rightarrow K^{*0}\mu^+\mu^- \quad \textbf{B} \rightarrow K^{(*)}\mu^+\mu^- \quad \textbf{B} \rightarrow \pi\mu\mu \quad \textbf{B} \rightarrow K^*\gamma \quad \text{Conclusions}$$

- Rare leptonic decays
  - $B^0_{(s)} \to \mu^+ \mu^-$  [PRL 108, 231801 (2012)]
  - $D^0 \rightarrow \mu^+ \mu^-$
  - $\tau \rightarrow \mu \mu \mu$ •  $B^0_{(s)} \rightarrow \mu^+ \mu^- \mu^+ \mu^-$
- ► Rare semi-leptonic decays
  - $B^0 \to K^{*0} \mu^+ \mu^-$  (angular analysis)
  - $B \to K^{(*)} \mu^+ \mu^-$  (isospin asymmetry)
  - $B^+ \to \pi^+ \mu^+ \mu^-$
- Rare radiative decays
  - $B^0 \to K^{*0} \gamma$  (CP asymmetry)

$$\text{Introduction} \quad \textbf{B} \to \mu\mu \quad D \to \mu\mu \quad \tau \to 3\mu \quad B \to 4\mu \quad B^0 \to K^{*0}\mu^+\mu^- \quad B \to K^{(*)}\mu^+\mu^- \quad B \to \pi\mu\mu \quad B \to K^*\gamma \quad \text{Conclusions}$$

$$B^0_{(s)} 
ightarrow \mu^+ \mu^-$$

#### Motivation

Low uncertainty in SM predictions [A. Buras et al., JHEP 1010 (2010)] [E. Gamiz et al., Phys. Rev. D 80 (2009) 014503].

$$\mathcal{B}(B_s^0 \to \mu^+ \mu^-) = (3.2 \pm 0.2) \times 10^{-9} \times 1.1 (*) \mathcal{B}(B^0 \to \mu^+ \mu^-) = (0.10 \pm 0.01) \times 10^{-9}$$

- Sensitive to NP scalar and/or pseudo-scalar contributions (extended Higgs sectors)
- ► (\*)De Bruyn et al., arXiv:1204.1735

### Analysis

- Candidates classified according to: invariant mass and MVA BDT
- BDT: 9 variables describing event topology/kinematics trained on MC and calibrated on data

Combinatorial background (from semilept B decays) Peaking background (from  $B \rightarrow hh'$ ) Cross-feed

SM signal  $\epsilon(hh \rightarrow \mu\mu) \ 3.5 \times 10^{-5}$ 

Giampiero Mancinelli

ntroduction 
$$B \rightarrow \mu\mu$$
  $D \rightarrow \mu\mu$   $\tau \rightarrow 3\mu$   $B \rightarrow 4\mu$   $B^0 \rightarrow K^{*0}\mu^+\mu^ B \rightarrow K^{(*)}\mu^+\mu^ B \rightarrow \pi\mu\mu$   $B \rightarrow K^*\gamma$  Conclusions

$$B^0_{(s)} 
ightarrow \mu^+ \mu^-$$

#### Results

Limits are extracted from data and expectations with the CL<sub>s</sub> method:

- Data compatible with Bkg+SM within 1σ
- ▶ **p-value** (1-CL<sub>b</sub>) = 18%

 $B^0 \rightarrow \mu^+ \mu^-$ upper limit (95% C.L. )

Exp. Bkg Only

 $1.1 \times 10^{-9}$ 

Yellow: region 68% compatible with bkg  $(B_d)$  or bkg + SM  $(B_s)$  signal hypothesis. Dashed line: expected median. Blue line: observed CL<sub>s</sub>. Introduction  $B \rightarrow \mu \mu$   $D \rightarrow \mu \mu$   $\tau \rightarrow 3\mu$   $B \rightarrow 4\mu$   $B^0 \rightarrow K^{*0}\mu^+\mu^ B \rightarrow K^{(*)}\mu^+\mu^ B \rightarrow \pi\mu\mu$   $B \rightarrow K^*\gamma$  Conclusions

$$B^0_{(s)} 
ightarrow \mu^+ \mu^-$$

#### New: Combination CMS-ATLAS-LHCb

LHCb-CONF-2012-017 **Upper Limits (95% C.L. ):** 

 $\mathcal{B}(B_s^0 \to \mu^+ \mu^-) < 4.2 \times 10^{-9}$  $\mathcal{B}(B^0 \to \mu^+ \mu^-) < 8.1 \times 10^{-10}$ 

LHCb limit dominating the combination Approaching  $\mathcal{B}(B_s^0 \to \mu^+ \mu^-)$  SM prediction.

ntroduction 
$$B \to \mu\mu$$
  $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

$$B^0_{(s)} 
ightarrow \mu^+ \mu^-$$

#### **Implications and Prospects**

#### Prospect for a $3\sigma$ observation:

Giampiero Mancinelli

$$\text{Introduction} \quad B \to \mu \mu \quad D \to \mu \mu \quad \tau \to 3 \mu \quad B \to 4 \mu \quad B^0 \to K^{*0} \mu^+ \mu^- \quad B \to K^{(*)} \mu^+ \mu^- \quad B \to \pi \mu \mu \quad B \to K^* \gamma \quad \text{Conclusions}$$

- ► Rare leptonic decays
  - $B^0_{(s)} \rightarrow \mu^+ \mu^-$ •  $D^0 \rightarrow \mu^+ \mu^-$  [LHCb-CONF-2012-005]
  - $\tau \to \mu \mu \mu$ •  $B^0_{(s)} \to \mu^+ \mu^- \mu^+ \mu^-$
- ► Rare semi-leptonic decays
  - $B^0 \to K^{*0} \mu^+ \mu^- (\mathcal{A}_{FB})$
  - $B \to K^{(*)} \mu^+ \mu^-$  (isospin asymmetry)
  - $B^+ \to \pi^+ \mu^+ \mu^-$
- Rare radiative decays
  - $B^0 \to K^{*0} \gamma$  (CP asymmetry)

ntroduction 
$$B \to \mu\mu$$
  $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

## $D^0 ightarrow \mu^+ \mu^-$

#### Introduction

- Suppression of FCNC in charm sector driven by GIM mechanism;
- SM prediction:  $10^{-13} < \mathcal{B}(D^0 \to \mu^+ \mu^-) < 6 \times 10^{-11}$  [G. Burdman *et al.*, PR D66 (2002)];
- ► Enhancement in NP models through presence down-type SUSY particles (R parity violating MSSM):  $\mathcal{B}(D^0 \to \mu^+ \mu^-) < 4.8 \times 10^{-9} \times \left(\frac{300 \, MeV}{m_d}\right)$ [E. Golowich *et al.*, PR D79 (2009)] (*m\_d* down-type quark superpartner's mass)
- ▶ Pre-LHC limit: Belle @ 90% CL  $\mathcal{B}(D^0 \to \mu^+ \mu^-) < 1.4 \times 10^{-7}$  [E. Petric *et al.*, PR D81 (2010) 091102] BaBar [0.6, 8.1]x10<sup>-7</sup> arXiv:1206.5419

#### Analysis

- Select D\* samples  $(D^{*+} \rightarrow D^0 (\rightarrow x^+ x'^-) \pi^+, x = \mu, K, \pi)$
- ► Main backgrounds: combinatorial background from semileptonic b- and c- hadron decays (reduced with MVA BDT) Peaking mis-identified  $D^{*+} \rightarrow D^0 (\rightarrow h^+ h'^-) \pi^+$  (reduced with tight PID requirements).

• 
$$D^{*+} \rightarrow D^0 (\rightarrow \pi^+ \pi^-) \pi^+$$

•  $D^{*+} \rightarrow D^0 (\rightarrow K^- \pi^+) \pi^+$ 

Introduction  $B \to \mu\mu$   $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

## $D^0 o \mu^+ \mu^-$

#### Results

$$\blacktriangleright \ \mathcal{B}(D^0 \to \mu^+ \mu^-) = \frac{N_{D^{*+} \to D^0(\to \mu^+ \mu^-)\pi^+}}{N_{D^{*+} \to D^0(\to \pi^+ \pi^-)\pi^+}} \times \frac{\epsilon_{\pi\pi}}{\epsilon_{\mu\mu}} \times \mathcal{B}(D^0 \to \pi^+ \pi^-),$$

• extracting yields from 2D fit:  $m(D^0)$  vs  $m(D^{*+}-D^0)$ 

$$\text{Introduction} \quad B \to \mu \mu \quad D \to \mu \mu \quad \tau \to \mathbf{3} \mu \quad B \to 4 \mu \quad B^0 \to K^{*0} \mu^+ \mu^- \quad B \to K^{(*)} \mu^+ \mu^- \quad B \to \pi \mu \mu \quad B \to K^* \gamma \quad \text{Conclusions}$$

- Rare leptonic decays ►
  - $B^0_{(s)} \rightarrow \mu^+ \mu^-$
  - $D^0 \rightarrow \mu^+ \mu^-$
  - $\tau \rightarrow \mu \mu \mu$  [LHCb-CONF-2012-015]
  - $B^0_{(s)} \to \mu^+ \mu^- \mu^+ \mu^-$
- Rare semi-leptonic decays ►

• 
$$B^0 \to K^{*0} \mu^+ \mu^- (\mathcal{A}_{FB})$$

- $B \to K^{(*)} \mu^+ \mu^-$  (isospin asymmetry)  $B^+ \to \pi^+ \mu^+ \mu^-$
- Rare radiative decays ►
  - $B^0 \to K^{*0} \gamma$  (CP asymmetry)

Introduction  $B \rightarrow \mu\mu$   $D \rightarrow \mu\mu$   $\tau \rightarrow 3\mu$   $B \rightarrow 4\mu$   $B^0 \rightarrow K^{*0}\mu^+\mu^- B \rightarrow K^{(*)}\mu^+\mu^- B \rightarrow \pi\mu\mu$   $B \rightarrow K^*\gamma$  Conclusions

#### $au o \mu \mu \mu$

#### Introduction

- LFV decay, ν oscillations, extremely suppressed within SM (in the charged sector: BR<10<sup>-40</sup>) and beyond current experimental sensitivities.
- cLFV largely enhanced in several NP scenarios in τ more than in μ decays:

 $\mathcal{B}(\tau \rightarrow \mu \mu \mu) < 10^{-7}$  Little Higgs

[M. Blanke et al., Acta Phys. Pol B41 (2010) 657]

Current limits at 90% CL:

BaBar  $\mathcal{B}(\tau \to \mu\mu\mu) < 3.3 \times 10^{-8}$ Belle  $\mathcal{B}(\tau \to \mu\mu\mu) < 2.1 \times 10^{-8}$ [PDG, J Phys G37 (2010) 075021]

• Large  $\sigma_{\tau}^{prod} \sim 80 \mu b$  at LHC

#### Analysis

- Loose selection + further event classification in a 3D space:
  - MVA BDT (geo and kin info) to reduce combinatorial background (5 bins)
  - MVA BDT (PID) to estimate compatibility with  $\mu$  hypothesis (5 bins)
  - Invariant mass  $m_{\mu\mu\mu}$  (6 bins)

$$\text{Introduction} \quad B \to \mu \mu \quad D \to \mu \mu \quad \tau \to 3\mu \quad B \to 4\mu \quad B^0 \to K^{*0} \mu^+ \mu^- \quad B \to K^{(*)} \mu^+ \mu^- \quad B \to \pi \mu \mu \quad B \to K^* \gamma \quad \text{Conclusions}$$

#### $au ightarrow \mu \mu \mu$

#### Results

 $\leftarrow ({\rm Highest~4~2D~bins~in~BDT(Geo-Kin)~and~BDT(PID)}) \\ {\rm Total,~Combinatorial,~} D_s^- \rightarrow \eta (\mu \mu \gamma) \mu^- \nu_\mu$ 

$$\begin{aligned} \mathcal{B}(\tau \to \mu \mu \mu) &= \\ \mathcal{B}(D_s^- \to \phi(\mu \mu) \pi^-) \times \frac{f(\tau^-(D_s^+))}{\mathcal{B}(D_s^- \to \tau^- \nu_{\bar{\mu}})} \times \frac{\epsilon_{norm}}{\epsilon_{sig}} \times \frac{N_{sig}}{N_{norm}} \end{aligned}$$

$$N_{norm} \equiv N_{D_s^- \to \phi(\mu\mu)\pi^-} = 45500 \pm 400_{\text{stat}} \pm 800_{\text{syst}}$$

Expected CL<sub>s</sub> as a function of  $\mathcal{B}(\tau \rightarrow \mu \mu \mu)$  under bkg-only hypothesis; 68% and 95%

#### Observed:

 $\mathcal{B}(\tau \to \mu\mu\mu) < 6.3(7.8) \times 10^{-8}$  at 90(95)% CL Close to B-factories sensitivity. Proof of principle: measurement can be made in hadronic environment (LHCb upgrade)

ntroduction 
$$B \to \mu\mu$$
  $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

- ► Rare leptonic decays
  - $B^0_{(s)} \rightarrow \mu^+ \mu^-$
  - $D^0 \rightarrow \mu^+ \mu^-$
  - $\tau \longrightarrow \mu \mu \mu$ •  $B^0_{(s)} \longrightarrow \mu^+ \mu^- \mu^+ \mu^-$  [LHCb-CONF-2012-010]
- ► Rare semi-leptonic decays
  - $B^0 \to K^{*0} \mu^+ \mu^- (\mathcal{A}_{FB})$
  - $B \to K^{(*)} \mu^+ \mu^-$  (isospin asymmetry)
  - $B^+ \rightarrow \pi^+ \mu^+ \mu^-$
- Rare radiative decays
  - $B^0 \to K^{*0} \gamma$  (CP asymmetry)

Introduction  $B \to \mu\mu$   $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

$$B^0_{(s)} 
ightarrow \mu^+ \mu^- \mu^+ \mu^-$$

#### Motivations

- ► In SM, large contribution from resonant  $B_s^0 \rightarrow J/\psi(\mu^+\mu^-)\phi(\mu^+\mu^-) (\mathcal{B} = 2.3 \pm 0.9) \times 10^{-8})$  [PDG, J. Phys. G37 (2010)]
- ► From other SM processes:  $\mathcal{B}(B^0_{(s)} \rightarrow \mu^+ \mu^- \gamma^* (\mu^+ \mu^-) \sim 10^{-10} - 10^{-11}$ [D. Melikhov, N. Nikitin, PR D70 (2004)]
- Enhancement possible in scenarios with new particles ( $\rightarrow \mu \mu$ )

#### Strategy: a cut and count analysis

- ► Resonant candidates  $B_s^0 \rightarrow J/\psi \phi(\rightarrow \mu \mu \mu \mu)$  used to optimize the selection (observed yield compatible with SM)
- For non-resonant mode, expected background:  $0.38^{+0.23}_{-0.17}$  in B<sup>0</sup>,  $0.30^{+0.22}_{-0.20}$  in B<sup>0</sup><sub>s</sub>
- Normalization to  $B^0 \rightarrow J/\psi(\mu^+\mu^-)\bar{K}^{0*}(K^+\pi^-)$

ntroduction 
$$B \rightarrow \mu\mu$$
  $D \rightarrow \mu\mu$   $\tau \rightarrow 3\mu$   $B \rightarrow 4\mu$   $B^0 \rightarrow K^{*0}\mu^+\mu^- B \rightarrow K^{(*)}\mu^+\mu^- B \rightarrow \pi\mu\mu$   $B \rightarrow K^*\gamma$  Conclusions

$$B^0_{(s)} 
ightarrow \mu^+ \mu^- \mu^+ \mu^-$$

#### Results

- Unblinded event distribution in the non-resonant mass window
- Compatible with background expectation

▶ Preliminary upper limits (95%C.L.) extracted with the CL<sub>s</sub> method:

$$\mathcal{B}(B_s^0 \to \mu^+ \mu^- \mu^+ \mu^-) < 1.3 \times 10^{-8}$$
  
$$\mathcal{B}(B^0 \to \mu^+ \mu^- \mu^+ \mu^-) < 5.4 \times 10^{-9}$$

First limits on these processes.

$$\text{Introduction} \quad B \to \mu \mu \quad D \to \mu \mu \quad \tau \to 3 \mu \quad B \to 4 \mu \quad B^0 \to K^{*0} \mu^+ \mu^- \quad B \to K^{(*)} \mu^+ \mu^- \quad B \to \pi \mu \mu \quad B \to K^* \gamma \quad \text{Conclusions}$$

- ► Rare leptonic decays
  - $B^0_{(s)} \rightarrow \mu^+ \mu^-$

## $B^0 \rightarrow K^{*0} \mu^+ \mu^-$

#### Yield extraction

- Sensitive to magnetic and vector and axial semileptonic penguin operators C7, C9, and C10
- Goal: measure angular observables (NP)
- Yield extraction: loose selection + MVA BDT (Topology, Kinematics, PID)
- Peaking backgrounds:  $B^0 \to K^{*0}J/\psi \ (\pi \to \mu, \mu \to \pi)$ ,  $B_{\rm s}^0 \to \phi \mu^+ \mu^- (1.5 \pm 0.5)\%$
- Yield =  $900 \pm 34$  (more than BaBar+Belle+CDF)

#### Angular analysis

- Decay described with 3 angles  $(\theta_l, \theta_k, \phi)$  and dimuon mass  $q^2$
- Parametrized in terms of angular observables ►

 $\frac{1}{\Gamma} \frac{\mathrm{d}^4 \Gamma}{\mathrm{d} \cos \theta_k \, \mathrm{d} \hat{\phi} \, \mathrm{d} q^2} = \frac{9}{16\pi} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K + \frac{3}{4} (1 - F_L) (1 - \cos^2 \theta_K) \right] + \frac{1}{4} \left[ F_L \cos^2 \theta_K +$  $F_{\ell}\cos^2\theta_{\ell}(2\cos^2\theta_{\ell}-1)$  +  $\frac{1}{4}(1-F_L)(1-\cos^2 heta_K)(2\cos^2 heta_\ell-1) +$  $S_3(1-\cos^2\theta_K)(1-\cos^2\theta_\ell)\cos 2\hat{\phi} +$  $\frac{4}{2}A_{FB}(1-\cos^2\theta_K)\cos\theta_\ell +$ AIM, T-odd CP

### **ISOSPIN ASYMMETRY**

#### Introduction

$$- \frac{\mathcal{B}(B^0 \to K^{(*)0} \mu^+ \mu^-) - \frac{\tau_0}{\tau_+} \mathcal{B}(B^{\pm} \to K^{(*)\pm} \mu^+ \mu^-)}{\pi_+}$$

• Definition: 
$$A_l \equiv \frac{\tau_+}{\mathcal{B}(B^0 \to K^{(*)0} \mu^+ \mu^-) + \frac{\tau_0}{\tau_+} \mathcal{B}(B^{\pm} \to K^{(*)\pm} \mu^+ \mu^-)}$$

- ► Within SM,  $A_l \sim 0$  (being  $\mathcal{O}(10\%)$  at  $q^2 \to 0$  for  $B^0 \to K^{*0}\mu^+\mu^-$ ) [T. Feldman and J. Matias, JHEP 01 (2003) 074]
- ► Pre-LHC experimental status: [BaBar, PRL 102 (2008)], [Belle, PRL 103 (2009)], [CDF, PRL 107 (2011)] overall consistent with SM (but  $3.9\sigma$  from SM in combined BaBar  $K^{(*)}$  below  $J/\psi$ ).

#### Analysis

- ► Selection optimized to have consistent samples and Yields extracted through fit q<sup>2</sup> bins.
- Consistent with SM and Belle/Babar in  $B \to K^* \mu^+ \mu^-$
- BUT discrepancy in B → Kμ<sup>+</sup>μ<sup>-</sup>. Naive average over the q<sup>2</sup> bins gives a 4.4σ effect. Unexpected! More statistics is needed.

Giampiero Mancinelli

## $B^+ \rightarrow \pi^+ \mu^+ \mu^-$

#### Introduction

•  $b \rightarrow d\mu\mu$  transition never observed before. SM prediction:

$${\cal B}(B^+ o \pi^+ \mu^+ \mu^-) = (1.96 \pm 0.21) imes 10^{-8}$$
 [S. Hai-Zhen *et al.*, CTP 50 (2008) 696]

• Previous best limit from Belle  $\mathcal{B} < 6.9 \times 10^{-8} @90\% CL$  [PRD 78 (2008) 011101]

#### Analysis

- MVA BDT to suppress combinatorial background
- vield extracted by means of EML fit:
  - mis-identified  $B^+ \to K^+ \mu^+ \mu^-$
  - partially reconstructed background
  - combinatorial background (not shown)
  - signal using  $B^+ \rightarrow J/\psi K^+$  as a proxy
- $25.3^{+6.7}_{-6.4}$  events (syst included),  $5.2\sigma$  significance

LHCb Preliminary

• Normalize to  $B^+ \rightarrow J/\psi K^+$ :  $\mathcal{B}(B^+ \to \pi^+ \mu^+ \mu^-) = (2.4 \pm 0.6_{(stat)} \pm 0.2_{(syst)}) \times 10^{-8}$  - Preliminary

#### Rarest B decay ever observed.

ntroduction 
$$B \rightarrow \mu\mu$$
  $D \rightarrow \mu\mu$   $\tau \rightarrow 3\mu$   $B \rightarrow 4\mu$   $B^0 \rightarrow K^{*0}\mu^+\mu^- B \rightarrow K^{(*)}\mu^+\mu^- B \rightarrow \pi\mu\mu$   $B \rightarrow K^*\gamma$  Conclusions

- ► Rare leptonic decays
  - $B^0_{(s)} \rightarrow \mu^+ \mu^-$
  - $D^0 \rightarrow \mu^+ \mu^-$
  - $\tau \rightarrow \mu \mu \mu$ •  $B^0_{(s)} \rightarrow \mu^+ \mu^- \mu^+ \mu^-$
- ► Rare semi-leptonic decays
  - $B^0 \to K^{*0} \mu^+ \mu^-$  (angular analysis)
  - $B \to K^{(*)} \mu^+ \mu^-$  (isospin asymmetry)
  - $B^+ \to \pi^+ \mu^+ \mu^-$
- ► Rare radiative decays
  - $B^0 \rightarrow K^{*0} \gamma$  (CP asymmetry) [LHCb-CONF-2012-004]

ntroduction 
$$B \to \mu\mu$$
  $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

$$B^0 o K^{*0} \gamma$$

#### CP asymmetry

- In SM, B radiative decays proceed at leading order via electromagnetic penguins transitions
- Extensions of the SM predict additional one-loop contributions (sensitive to NP)

$$\begin{split} &\mathcal{A}_{CP}^{SM}(B^0 \to K^{*0}\gamma) = -0.0061 \pm 0.0043 \text{ [Y. Keum et al.,} \\ &\text{PRD 72 (2005) 014013]} \\ &\mathcal{A}_{CP}^{EXP}(B^0 \to K^{*0}\gamma) = -0.016 \pm 0.022 \pm 0.007 \\ &\text{[BaBar, PRL 103 (2009) 211802]} \end{split}$$

LHCb: 
$$\mathcal{A}_{CP}^{EXP} = \mathcal{A}_{CP}^{RAW} - \mathcal{A}_{K\pi}^{Det} - \kappa \mathcal{A}_{B^0}^{Prod}$$
;  
 $\mathcal{A}_{CP}^{RAW} = \frac{N(B^0) - N(B^0)}{N(B^0) + N(B^0)} = 0.003 \pm 0.017_{stat} \pm 0.007_{syst}$ .  
 $-\mathcal{A}_{K\pi}^{Det} = \frac{\epsilon_{(K^-\pi^+)} - \epsilon_{(K^+\pi^-)}}{\epsilon_{(K^-\pi^+)} + \epsilon_{(K^-\pi^+)}} = 0.010 \pm 0.002$ ,  
 $-\kappa \mathcal{A}_{B^0}^{Pod} = -0.004 \pm 0.005$ ;  
 $\mathcal{A}_{CP}^{EXP} = 0.008 \pm 0.017_{stat} \pm 0.009_{syst}$  - Preliminar

#### Most precise measurement

signal (dashed) combinatorial background (dashed)  $B \rightarrow K^{*0} \pi^0 X$  (dashed)  $B^+, 0 \rightarrow K^{*0} \pi^+, 0_{\gamma}$  (dotted)

#### Introduction $B \to \mu\mu$ $D \to \mu\mu$ $\tau \to 3\mu$ $B \to 4\mu$ $B^0 \to K^{*0}\mu^+\mu^- B \to K^{(*)}\mu^+\mu^- B \to \pi\mu\mu$ $B \to K^*\gamma$ Conclusions

## **CONCLUSIONS**

- ► Rare decays are powerful ways to search for NP beyond the SM
- ► LHCb strongly performing and very well positioned in this field
- World Best Limits on the measurements of  $\mathcal{B}(B^0_{(s)} \to \mu^+ \mu^-), \mathcal{B}(D^0 \to \mu^+ \mu^-)$
- First observation of  $B^+ \to \pi^+ \mu^+ \mu^-$
- Most precise measurements of angular observables and  $\mathcal{A}_{CP}(B^0 \to K^{*0}\gamma)$ .
- ► Still... consistency with SM in FCNC... but severe constraints on NP models... though the isospin asymmetry in  $B \rightarrow K^{(*)}\mu^+\mu^-$  decays...
- ► All measurements are still statistically limited expect further improvements.

## BACKUP

# Backup

- Significant NP BR enhancement in  $B_s \! \to \! \mu^+ \mu^-$  has been ruled out by the LHC, we are getting close to the SM value

⇒ It's important to understand the central value and uncertainty of the SM predictions

So far we used Buras prediction BR(B<sub>s</sub>→µ<sup>+</sup>µ<sup>-</sup>)= (3.2±0.2) x10<sup>-9</sup>

$$\mathcal{B}(B_q \to \mu^+ \mu^-) = 4.36 \cdot 10^{-10} \frac{\tau_{B_q}}{\hat{B}_q} \frac{Y^2(v)}{S(v)} \Delta M_q \quad \text{with } \mathsf{B_s} = 1.33 \pm 0.06 \quad \begin{array}{l} \mathsf{E}. \ \mathsf{Gamiz} \ \mathsf{et} \ \mathsf{al: Phys.Rev.D} \\ \mathsf{80} \ (2009) \ \mathsf{014503} \end{array}$$

Other possibility: take advantage of the improvement in f<sub>Bs</sub> from Lattice :

$$BR(B_s \rightarrow \mu^+ \mu^-) = \frac{G_F^2 \alpha^2}{64\pi^2} f_{B_s}^2 m_{B_s}^3 |V_{0b} V_{1s}^*|^2 \tau_{B_s} \sqrt{1 - \frac{4m_{\mu_s}^2}{m_{B_s}^2}} \qquad (2.4)$$

$$\times \left\{ \left(1 - \frac{4m_{\mu_s}^2}{m_{B_s}^2}\right) |C_{Q_1} - C_{Q_1}'|^2 + \left| (C_{Q_2} - C_{Q_2}') + 2(C_{10} - C_{10}') \frac{m_{\mu_s}}{m_{B_s}} \right|^2 \right\}.$$

• N. Mahmoudi et al (arXiv:1205.1845): (3.53 $\pm$ 0.38) x10<sup>-9</sup> using f<sub>Bs</sub> = (234 $\pm$ 10)MeV

• C. Davies (arXiv:1203.3862): (3.32±0.25)x10<sup>-9</sup> using f<sub>Bs</sub> = (227±4)MeV

Which value of f<sub>Bs</sub> should we use?

Introduction  $B \to \mu\mu$   $D \to \mu\mu$   $\tau \to 3\mu$   $B \to 4\mu$   $B^0 \to K^{*0}\mu^+\mu^ B \to K^{(*)}\mu^+\mu^ B \to \pi\mu\mu$   $B \to K^*\gamma$  Conclusions

- De Bruyn et al (arXiv:1204.1735): Need to take into account the B<sub>s</sub> mixing
  - Theoretically: CP-average at t=0
  - · Experimentally: CP-average integrated over t

$$BF (B_s \to f)_{theo} = \begin{bmatrix} 1 - y_s^2 \\ 1 + A_{\Delta\Gamma}^f y_s \end{bmatrix} BF (B_s \to f)_{exp} \qquad y_s = \frac{\Delta\Gamma_s}{2\Gamma_s}$$

$$0.911 \pm 0.014 \text{ for } B_s \to \mu^+\mu^- \text{ using}$$

$$y_s \text{ from } LHCb\text{-}CONF\text{-}2012\text{-}002$$

$$BR_{theo}(B_s \to \mu^+\mu^-) < 4.5 \times 0.911 = 4.1 \times 10^{-9} @ 95\% \text{ CL}$$
