

Production Activities and Requirements by ALICE

Patricia Méndez Lorenzo
(on behalf of the ALICE Collaboration)

Service Challenge Technical Meeting
CERN, 21st June 2006

Outline

- PDC'06/SC4 goals and tasks
- General aspects of ALICE software
- Principles of operation
- Medium-term plans – FTS transfers
- Site actions and requirements
- Open questions and conclusions

- Validation of the LCG/gLite workload management services
 - ❑ Stability of the services is fundamental for the entire duration of the exercise
- Validation of the data transfer and storage services
 - ❑ 2nd phase of the PDC'06
 - ❑ The stability and support of the services have to be assured beyond the throughput tests
- Validation of the ALICE distributed reconstruction and calibration model
- Integration of all Grid resources within one single – interfaces to different Grids (LCG, OSG, NDGF)
- End-user data analysis

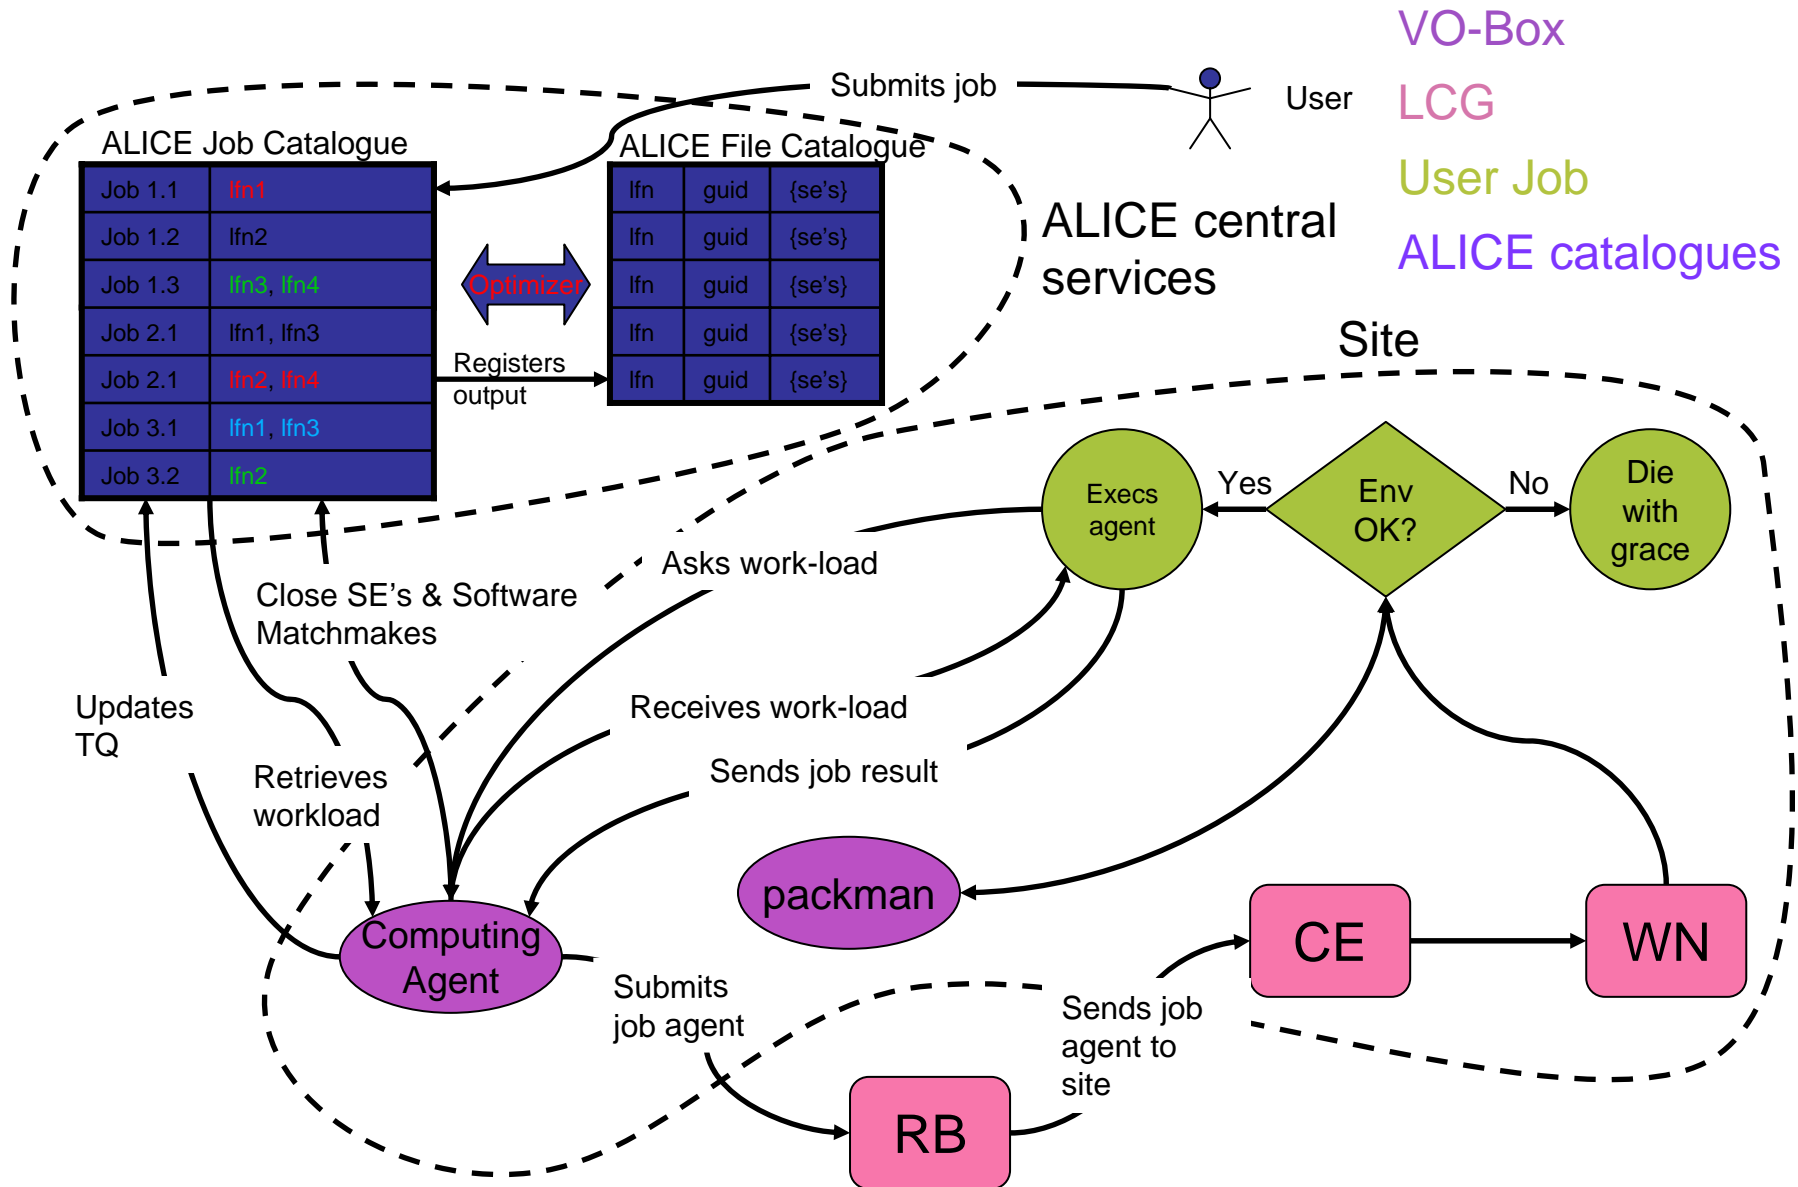

- First phase (ongoing):
 - ❑ Production of p+p and Pb+Pb MC events
 - ❑ Conditions and samples agreed with PWGs
 - ❑ Data migrated from all Tiers to CASTOR@CERN
- Second phase (July/August):
 - ❑ Scheduled data transfers T0-T1
 - ❑ Reconstruction of RAW data: 1st pass reconstruction at CERN, 2nd pass at T1 (August/September)
 - ❑ Scheduled data transfers T2- (supporting)T1
- Third phase (September/October)
 - ❑ End-user analysis on the GRID

- AliEn is the single entry point for all ALICE users to the Grid
 - ❑ Through interfaces it interacts with the services offered by the various Grids
 - ❑ Provides set of tools to complement the missing functionality in the Grid(s) implementation
- Central Task Queue and related services
 - ❑ Job optimization – job is sent to the data location
 - ❑ Resources use prioritization – down to user level
- Make full use of the underlying services
 - ❑ RB for the job agent submission
 - ❑ Data transfer and management
- Integration of the LCG services using high-level tools and APIs
 - ❑ Development with a high level of abstraction, thus hiding the complexity and shielding the users from implementation changes

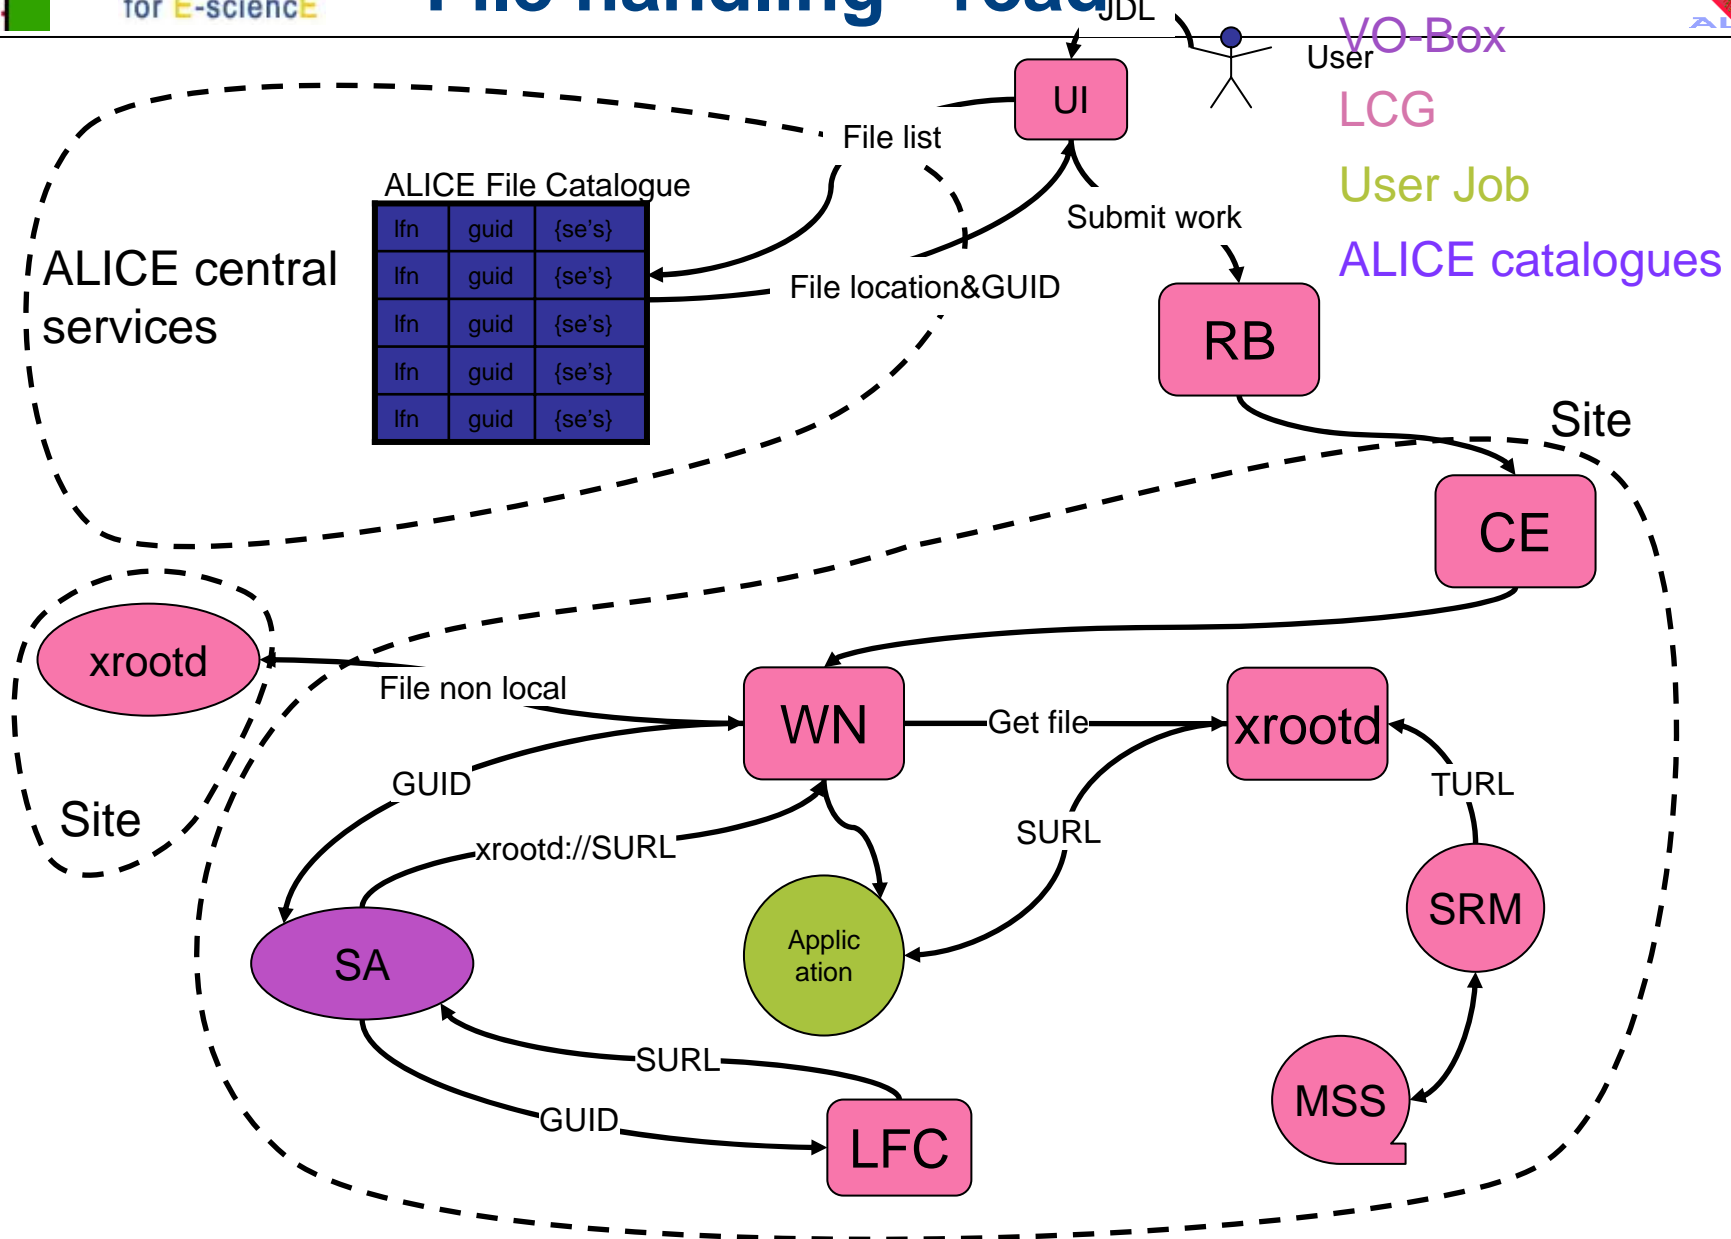

Job Submission Structure

File handling - read

- VO-boxes deployed at all T0-T1-T2 sites providing resources for ALICE
 - ❑ Required in addition to all standard LCG Services
 - ❑ Entry door to the LCG Environment
 - ❑ Runs standard LCG components and ALICE specific ones
- Uniform deployment
 - ❑ The services are exactly the same everywhere
- Installation and maintenance entirely ALICE responsibility
 - ❑ Based on a regional principle
 - ❑ Set of ALICE experts matched to groups of sites
- Site related problems handled by site administrators
- LCG Service problems reported via GGUS

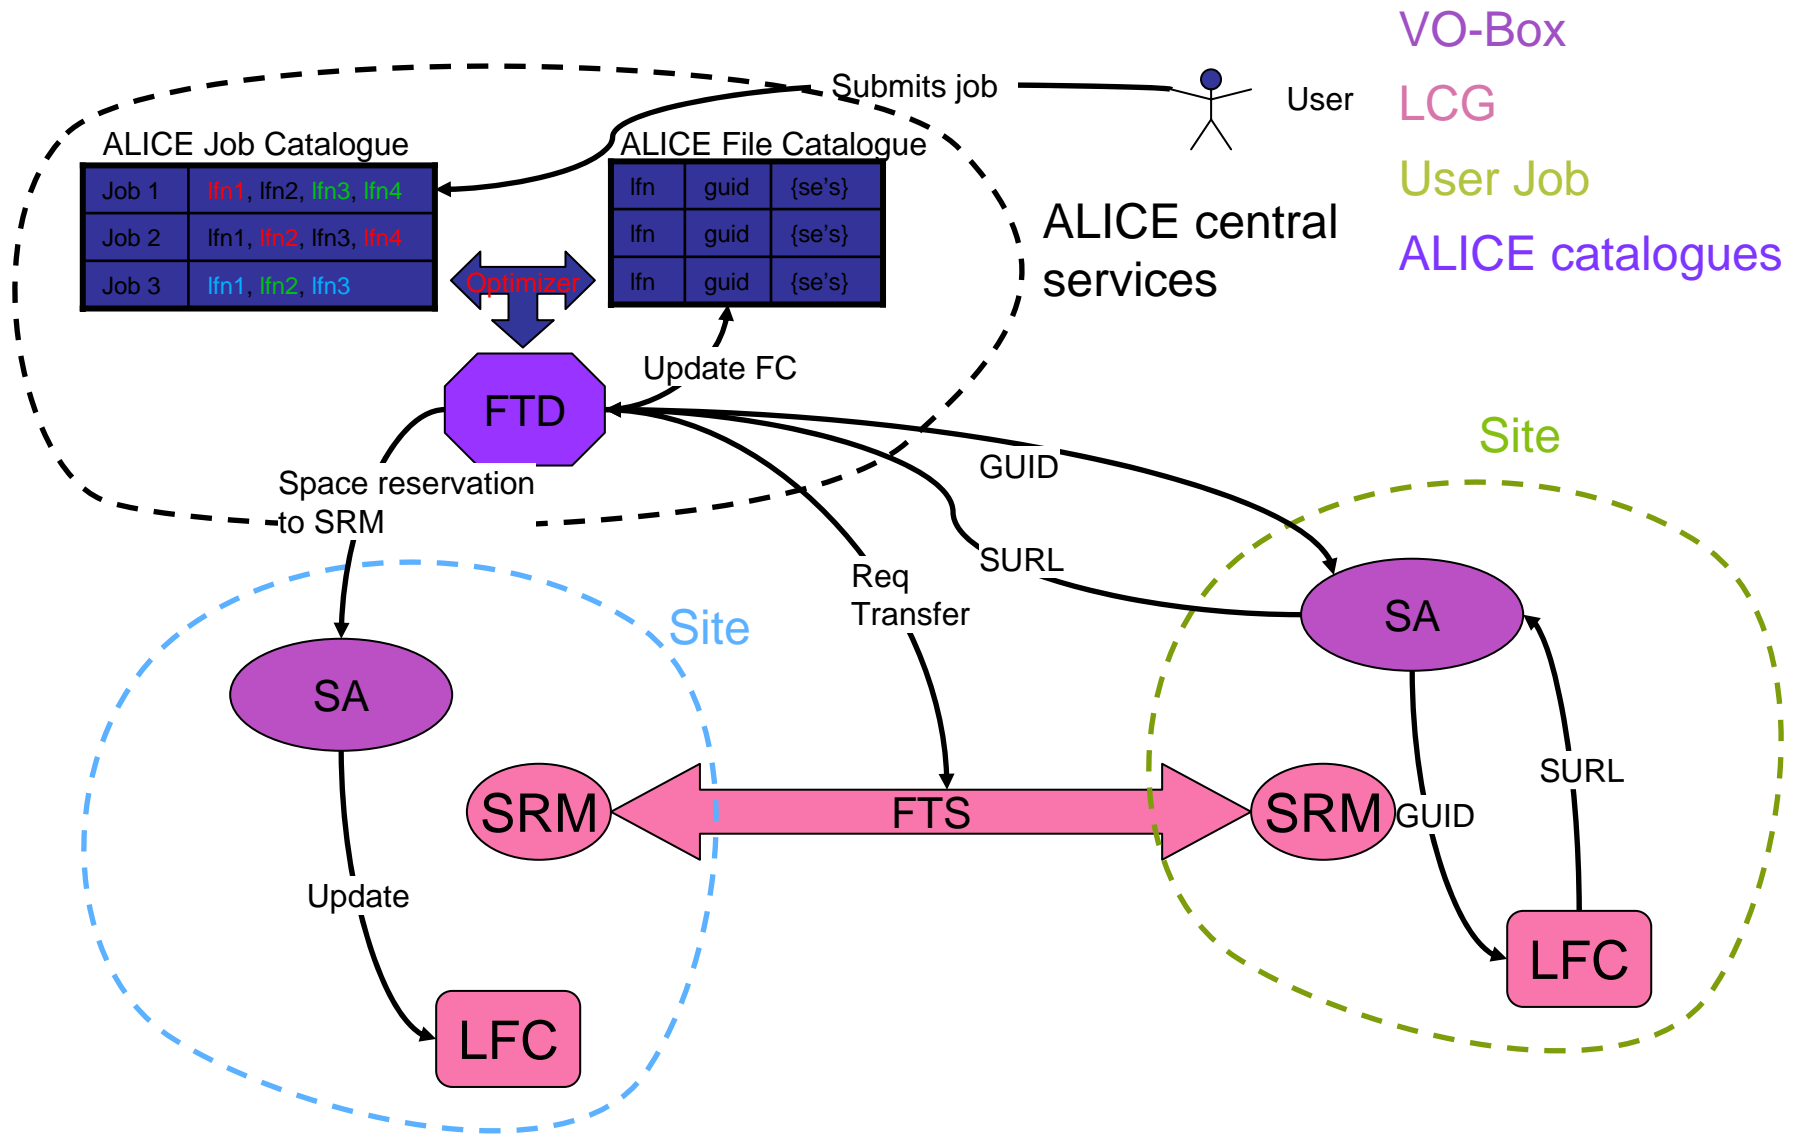

➤ FTS Service

- ❑ Used for scheduled replication of data between computing centers
- ❑ Lower level tool that underlies the data placement
- ❑ Used as plugin in the AliEn File Transfer Daemon (FTD)
 - FTS has been implemented through the FTS Perl APIs
 - FTD running in the VO-box as one of the ALICE services

➤ LFC required at all sites

- ❑ Used as a local catalogue for the site SE

File replication

- The wrapper has two main tasks
- **Submission**
 - ❑ The user specifies the SURL in the origin and in the destination...
And that`s all
 - It will extract the SEs at the origin and the destination
 - From the IS, the names of the sites will be extracted and also the FTS endpoint
 - The proxies status will be also checked
 - The transfer is performed
- **Retrieve**
 - ❑ Retrieves the status of all transfers associated to the previous submission
- **Additional Features**
 - ❑ Creates automatically a subdirectory where the IDs and the status of the transfers are stored
 - ❑ Allows the specification of a file containing several transfers

- The main goal is to test the stability of FTS as service and integration with FTD
 - ❑ T0-T1 (disk to tape): 7 days required of sustained transfer rates to all T1s
 - ❑ T1-T2 (disk to disk) and T1-T1 (disk to disk): 2 days required of sustained transfers to T2.
- Data types
 - ❑ T0-T1: Migration of raw and 1st pass reconstructed data
 - ❑ T1-T2 and T2-T1: Transfers of ESDs, AODs (T1-T2) and T2 MC production for custodial storage (T2-T1)
 - ❑ T1-T1: Replication of ESDs and AODs

FTS transfer plans

- Synchronized with the SC4 plans:
 - ❑ From 10th-23th July:
 - TEST AND DEBUGGING OF THE FTS WRAPPER AND STATUS OF THE SITES
 - ❑ From 24th-30th July (throughput and stability test):
 - Sustained export to the T1 sites at 300MB/s from the WAN pool (disk to tape)
 - Test the reconstruction part at 300MB/s from the Castor2-xrootd pool
 - ❑ From 31st July-6th August:
 - Run the full chain at 300MB/s DAQ-T0-tape+reconstruction+export from the same pool

- T0-T1: disk-tape transfers at an aggregate rate of 300MB/s from CERN
 - ❑ Distributed according the MSS resources pledged by the sites in the LCG MoU:
 - CNAF: 20%
 - CCIN2P3: 20%
 - GridKA: 20%
 - SARA: 10%
 - RAL: 10%
 - US (one center): 20%
- T1-T2: Following the T1-T2 relation matrix
 - ❑ Test of the services performance, no specific target for transfer rates

- For the throughput test (24th-30th July) the transferred data can be removed at the T1s
 - ❑ The sites should provide mechanism for garbage collection
- The FTS transfers will not be synchronous with the data production
- Transfers based on LFN is not required
- The automatic update of the LFC catalogue is not required
 - ❑ ALICE will take care of the catalogues update
- Summary of requirements:
 - ❑ ALICE FTS Endpoints at the T0 and T1
 - ❑ SRM-enabled storage with automatic data deletion if needed
 - ❑ FTS service at all sites
 - ❑ ***Support during the whole tests (and beyond)***

- CCIN2P3
 - ❑ French T2s, Sejong (Korea), Lyon T2, Madrid (Spain)
- CERN
 - ❑ Cape Town (South Africa), Kolkatta (India), T2 Federation (Romania), RMKI (Hungary), Athens (Greece), Slovakia, T2 Federation (Poland), Wuhan (China)
- FZK
 - ❑ FZU (Czech Republic), RDIG (Russia), GSI and Muenster (Germany)
- CNAF
 - ❑ ItalianT2s
- RAL
 - ❑ Birmingham
- SARA/NIKHEF
- NDGF
- PDSF
 - ❑ Houston

L. Robertson is setting up
a working group to
resolve the T1-T2
coordination

- We have some open questions, before the FTS transfers begin:
 - ❑ FTS service channels, endpoints and SRM-enabled SEs for ALICE
 - Is it a site-experiment negotiation?
 - The SC team will set-up and test the service, before a handling it to ALICE?
 - ❑ Support during the exercise
 - Location of the support team (central, distributed), site contacts
 - Everything through GGUS?

- The ALICE PDC`06
 - ❑ Complete test of the ALICE computing model and Grid services readiness for data taking in 2007
 - ❑ Production of data ongoing, integration of LCG and ALICE specific services through the VO-box framework progressing extremely well
 - ❑ Building of support infrastructure and relations with ALICE sites is on track
- The 2nd Phase of PDC'06 will begin with the FTS transfers (in the framework of SC4)
 - ❑ Test of the service stability and support
 - ❑ T0-T1 test will also show the sustainability of the target transfer rates (as specified in the ALICE computing model)
 - ❑ Still some open questions regarding the T2 association to a host T1
- The 3rd phase (end-user analysis) at the end of the year
