NICA

International Conference on New Frontiers in Physics
Conference Center of the Orthodox Academy of Crete
Kolymbari, Greece, September 5, 2013

The Nuclotron-based Ion Collider fAcility (NICA) at Joint Institute for Nuclear Research (JINR), Dubna

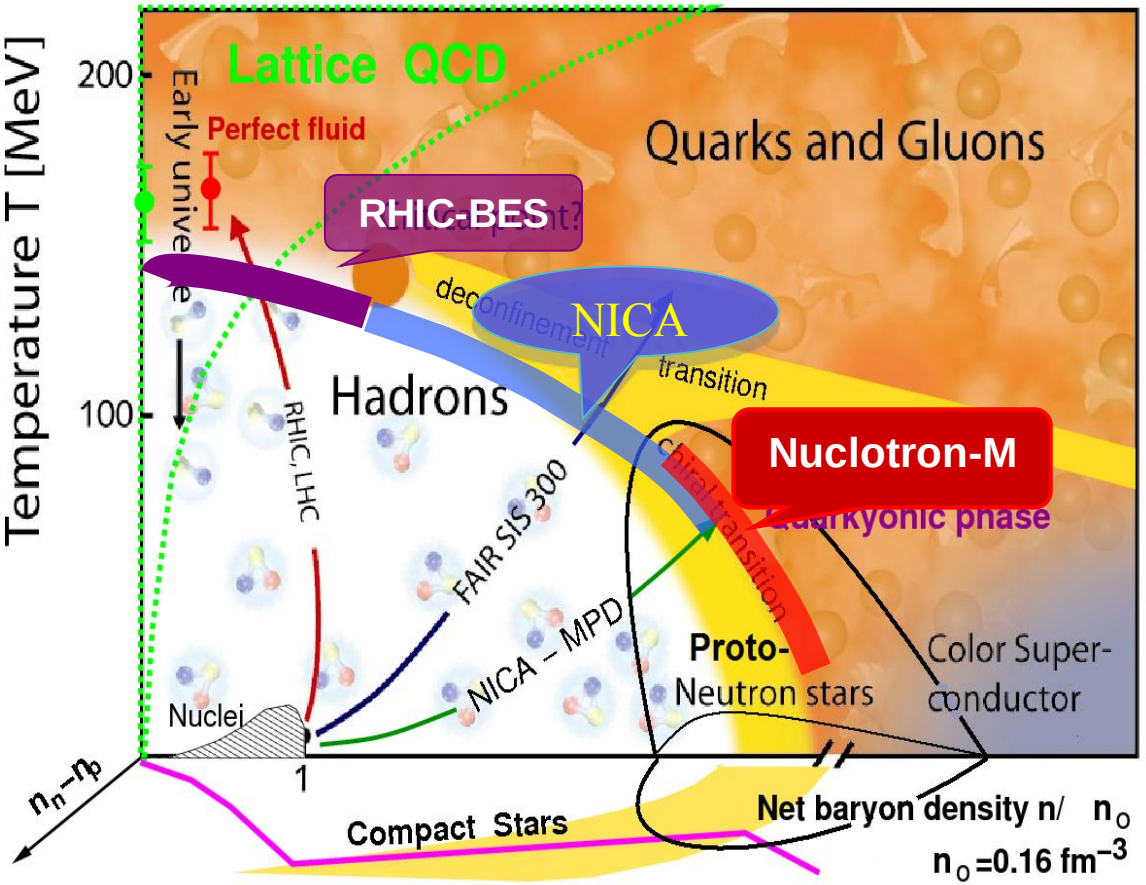
Main targets of **NICA**:

- *study of hot and dense baryonic matter*
- *investigation of nucleon spin structure, polarization phenomena*

***NICA** will provide intensive beams of ions from **p** to **Au** and polarized **protons** and **deuterons** with maximal energy up to*

$\sqrt{s_{NN}}$ = *11 GeV (Au^{79+}) and 27 GeV (p)*

QCD phase diagram: prospects for NICA



Energy Range of NICA

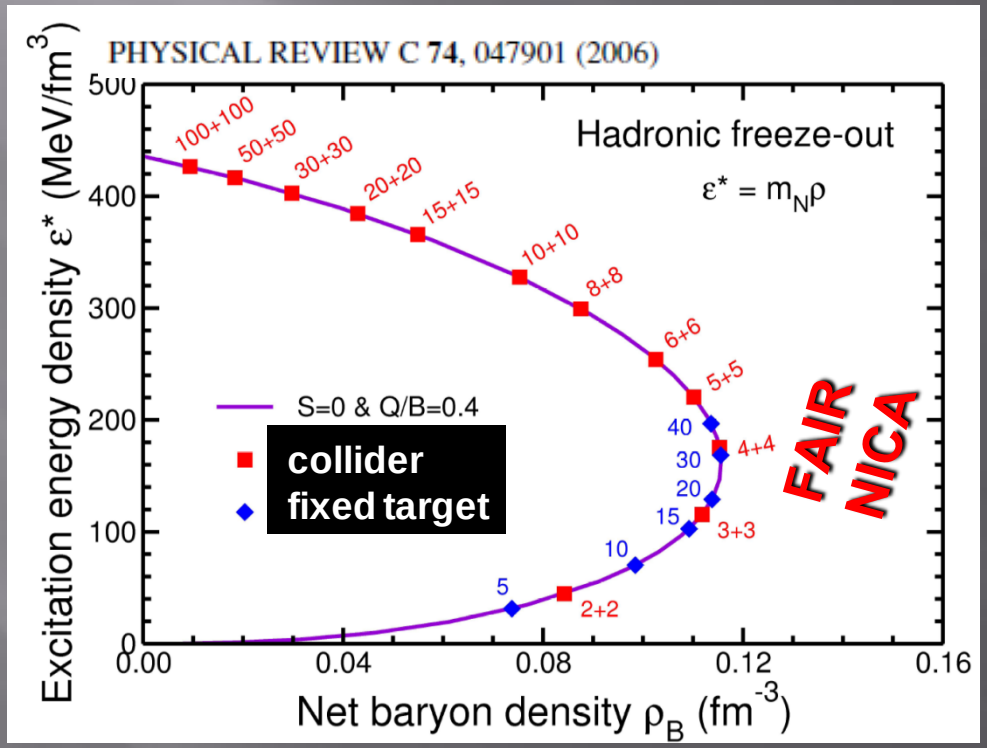
unexplored region of the QCD phase diagram:

- **Highest net baryon density**
- **Onset of deconfinement phase transition**
- **Discovery potential:**
  a) Critical End Point (CEP)
  b) Chiral Symmetry Restoration
  c) Hypothetic Quarkyonic phase
- **Complementary to the RHIC/BES, NA61/CERN, CBM/FAIR and Nuclotron-M experimental programs**

Comprehensive experimental program requires scan over the QCD phase diagram by varying collision parameters: system size, beam energy and collision centrality. NICA provides capabilities for studying a variety of phenomena in a large region of the phase diagram.

Highest baryon density at Lab

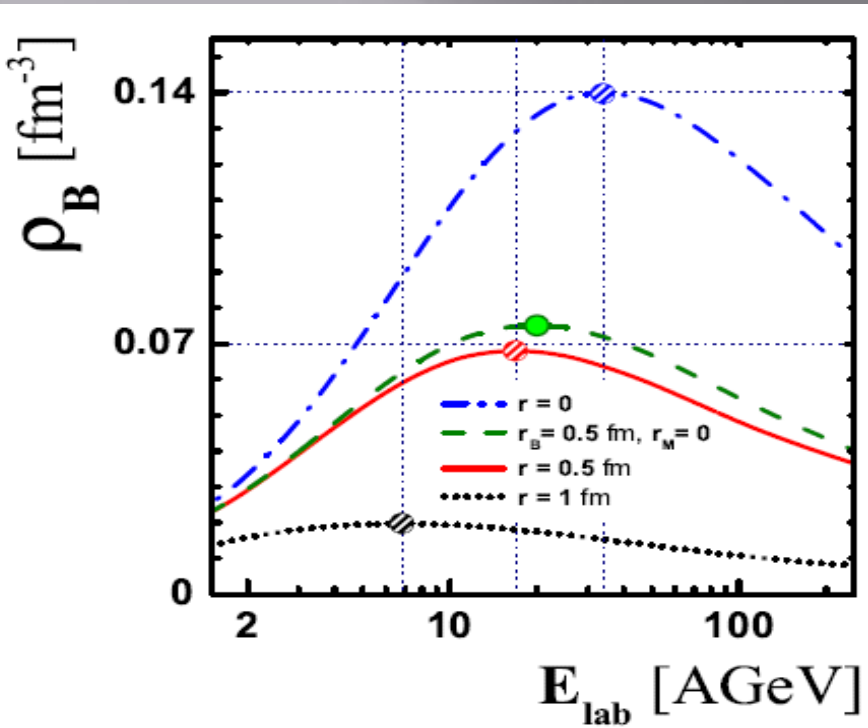
System of maximal net baryon (freeze-out) density is created in A+A collisions at NICA energies → optimum for the compressed baryon matter exploration

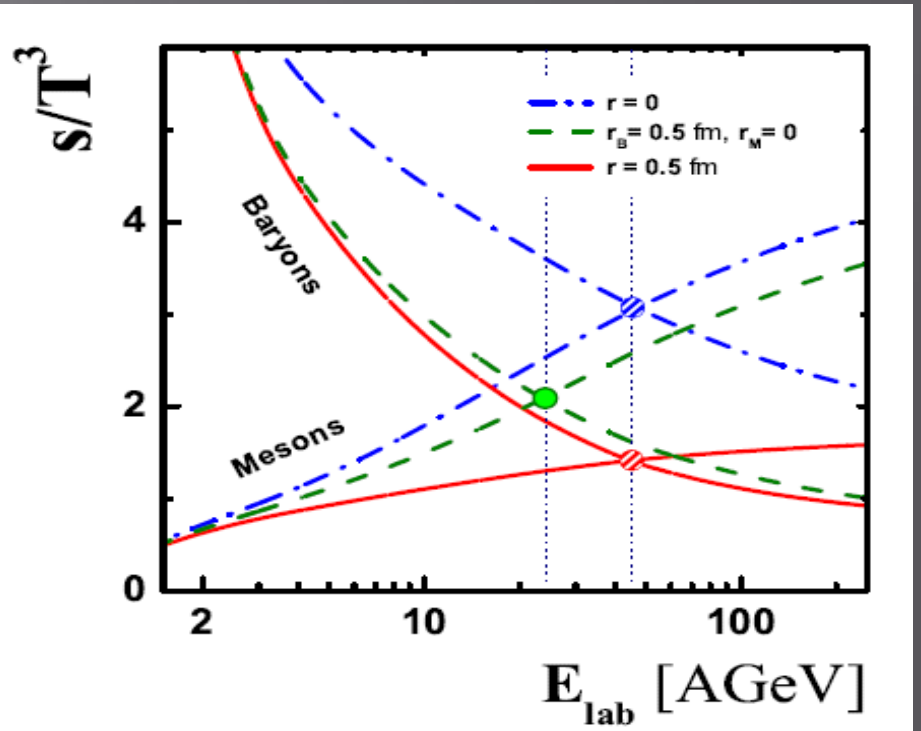


J.Randrup, J.Cleymans, 2006

Excluded volume effects on baryon density and transition from baryon to meson dominated matter

V. V. Begun, M. Gaździcki, M. I. Gorenstein (2013)





By varying the hadron radii in the range r = (0-1.0) fm the collision energy at which the baryon density is maximal changes between 7A and 34A GeV. This range is fully covered by the NICA collider. Thus experiments at NICA will allow to study in detail freeze-out conditions in heavy ion collisions in the domain of their rapid changes and the relation to the onset of deconfinement.

1a) Heavy ion colliding beams $^{197}Au^{79+}$ x $^{197}Au^{79+}$ at
$\sqrt{s_{NN}}$ = 4 ÷ 11 GeV (1 ÷ 4.5 GeV/u ion kinetic energy)
at Laverage= 1E27 $cm^{-2}\cdot s^{-1}$ (at √sNN = 9 GeV)

1b) Light-Heavy ion colliding beams of the same energy range and luminosity

2) Polarized beams of protons and deuterons in collider mode:
p↑p↑ √spp = 12 ÷ 27 GeV (5 ÷ 12.6 GeV kinetic energy)
d↑d↑ √sNN = 4 ÷ 13.8 GeV (2 ÷ 5.9 GeV/u ion kinetic energy
Laverage > 1E31 $cm^{-2}\cdot s^{-1}$ (at √s_pp = 27 GeV)

3) The beams of light ions and polarized protons and deuterons for fixed target experiments:
Li ÷ Au = 1 ÷ 4.5 GeV /u ion kinetic energy
p, p↑ = 5 ÷ 12.6 GeV kinetic energy
d, d↑ = 2 ÷ 5.9 GeV/u ion kinetic energy

4) Applied research with ion beams at kinetic energy from 0.5 GeV/u up to 12.6 GeV (p) and 4.5 GeV /u (Au)

MultiPurpose Detector (MPD): Observables

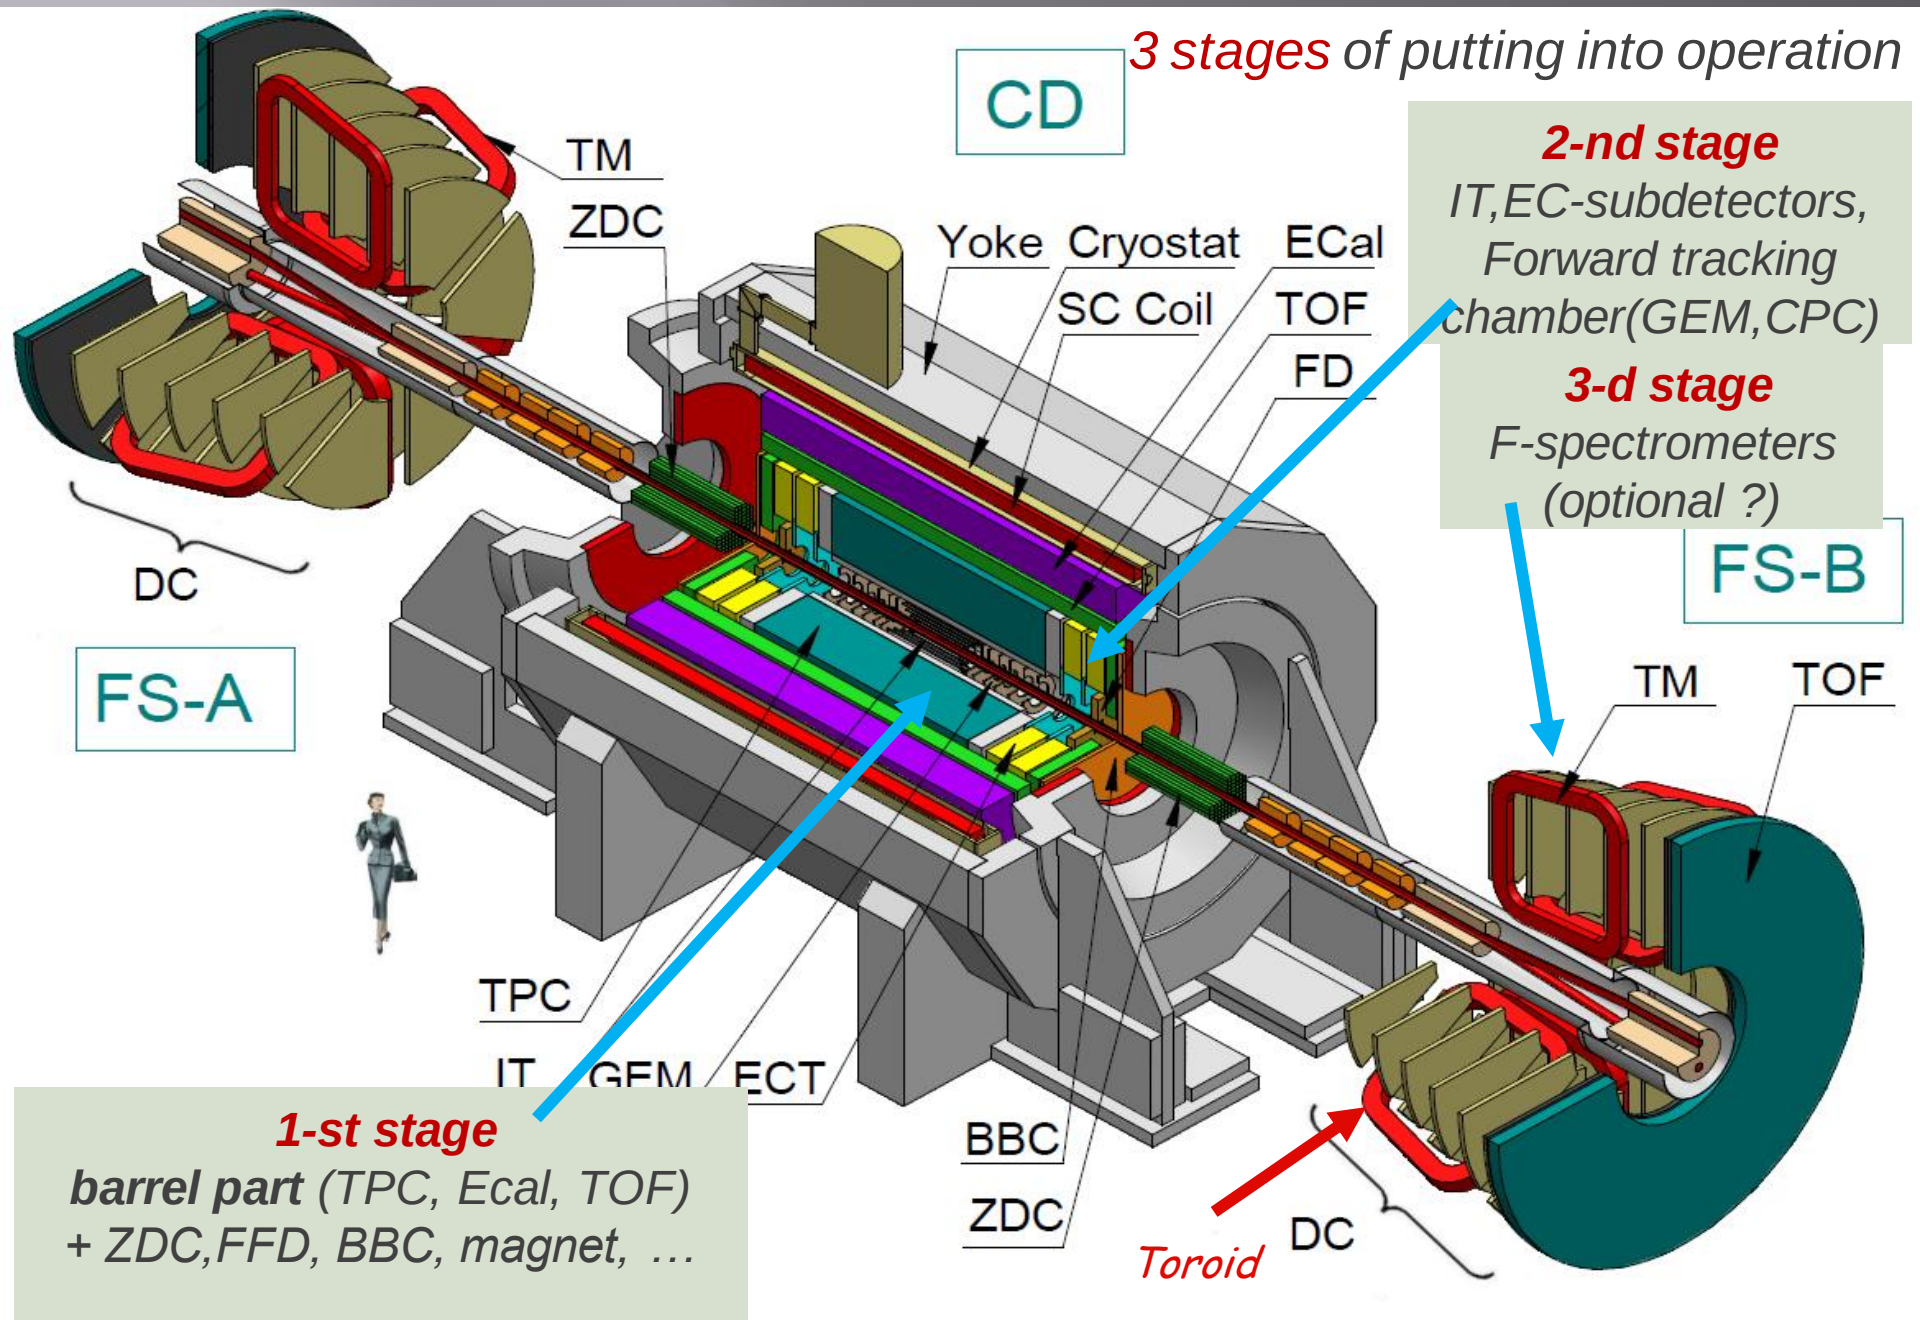
I stage: *mid rapidity region (good performance)*

- *Particle yields and spectra*
- *Event-by-event fluctuations*
- *Femtoscopy involving π, K, p, Λ*
- *Collective flows for identified hadron species*
- *Electromagnetic probes (electrons, gammas)*

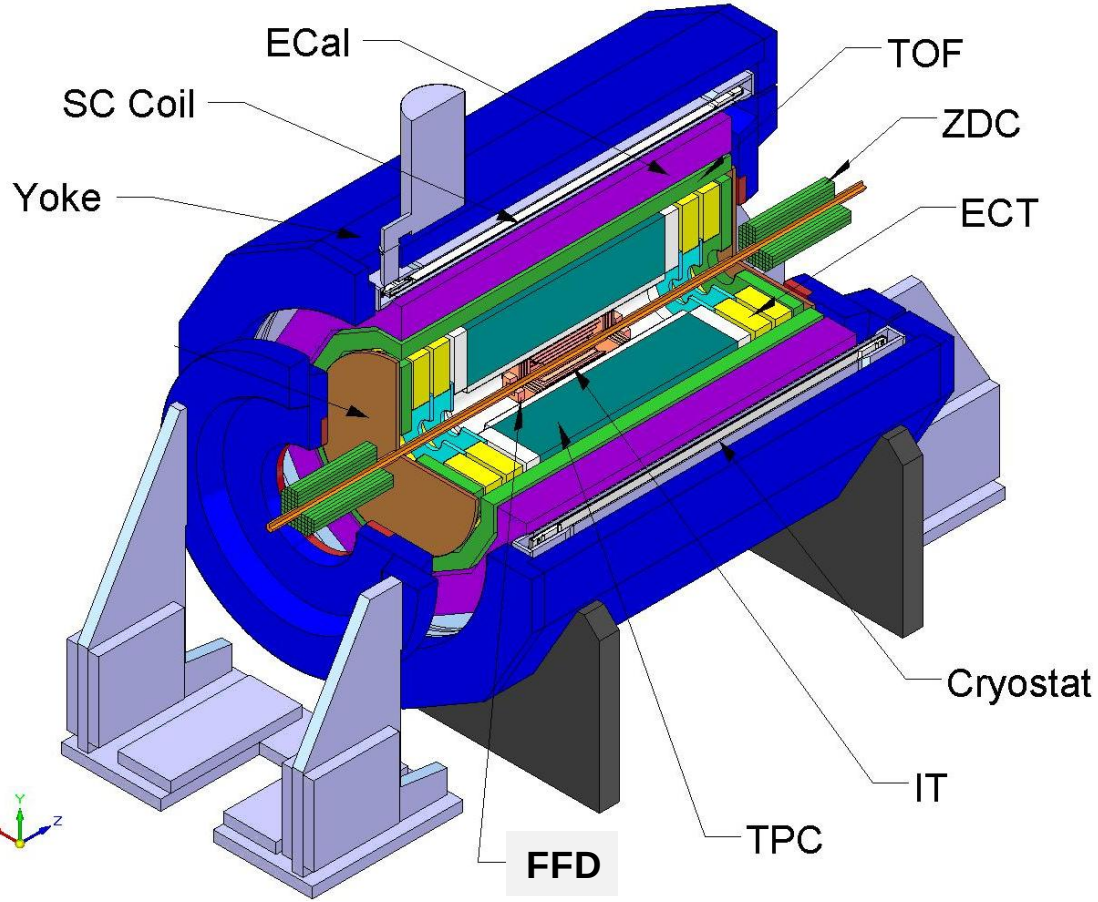
II stage: *extended rapidity + IT*

- *Total particle multiplicities*
- *Asymmetries study (better reaction plane determination)*
- *Di-Lepton precise study (ECal expansion)*
- *Exotics (soft photons, hypernuclei)*

MultiPurpose Detector (MPD)



The MPD Apparatus



Magnet : 0.5 T superconductor

Tracking : TPC

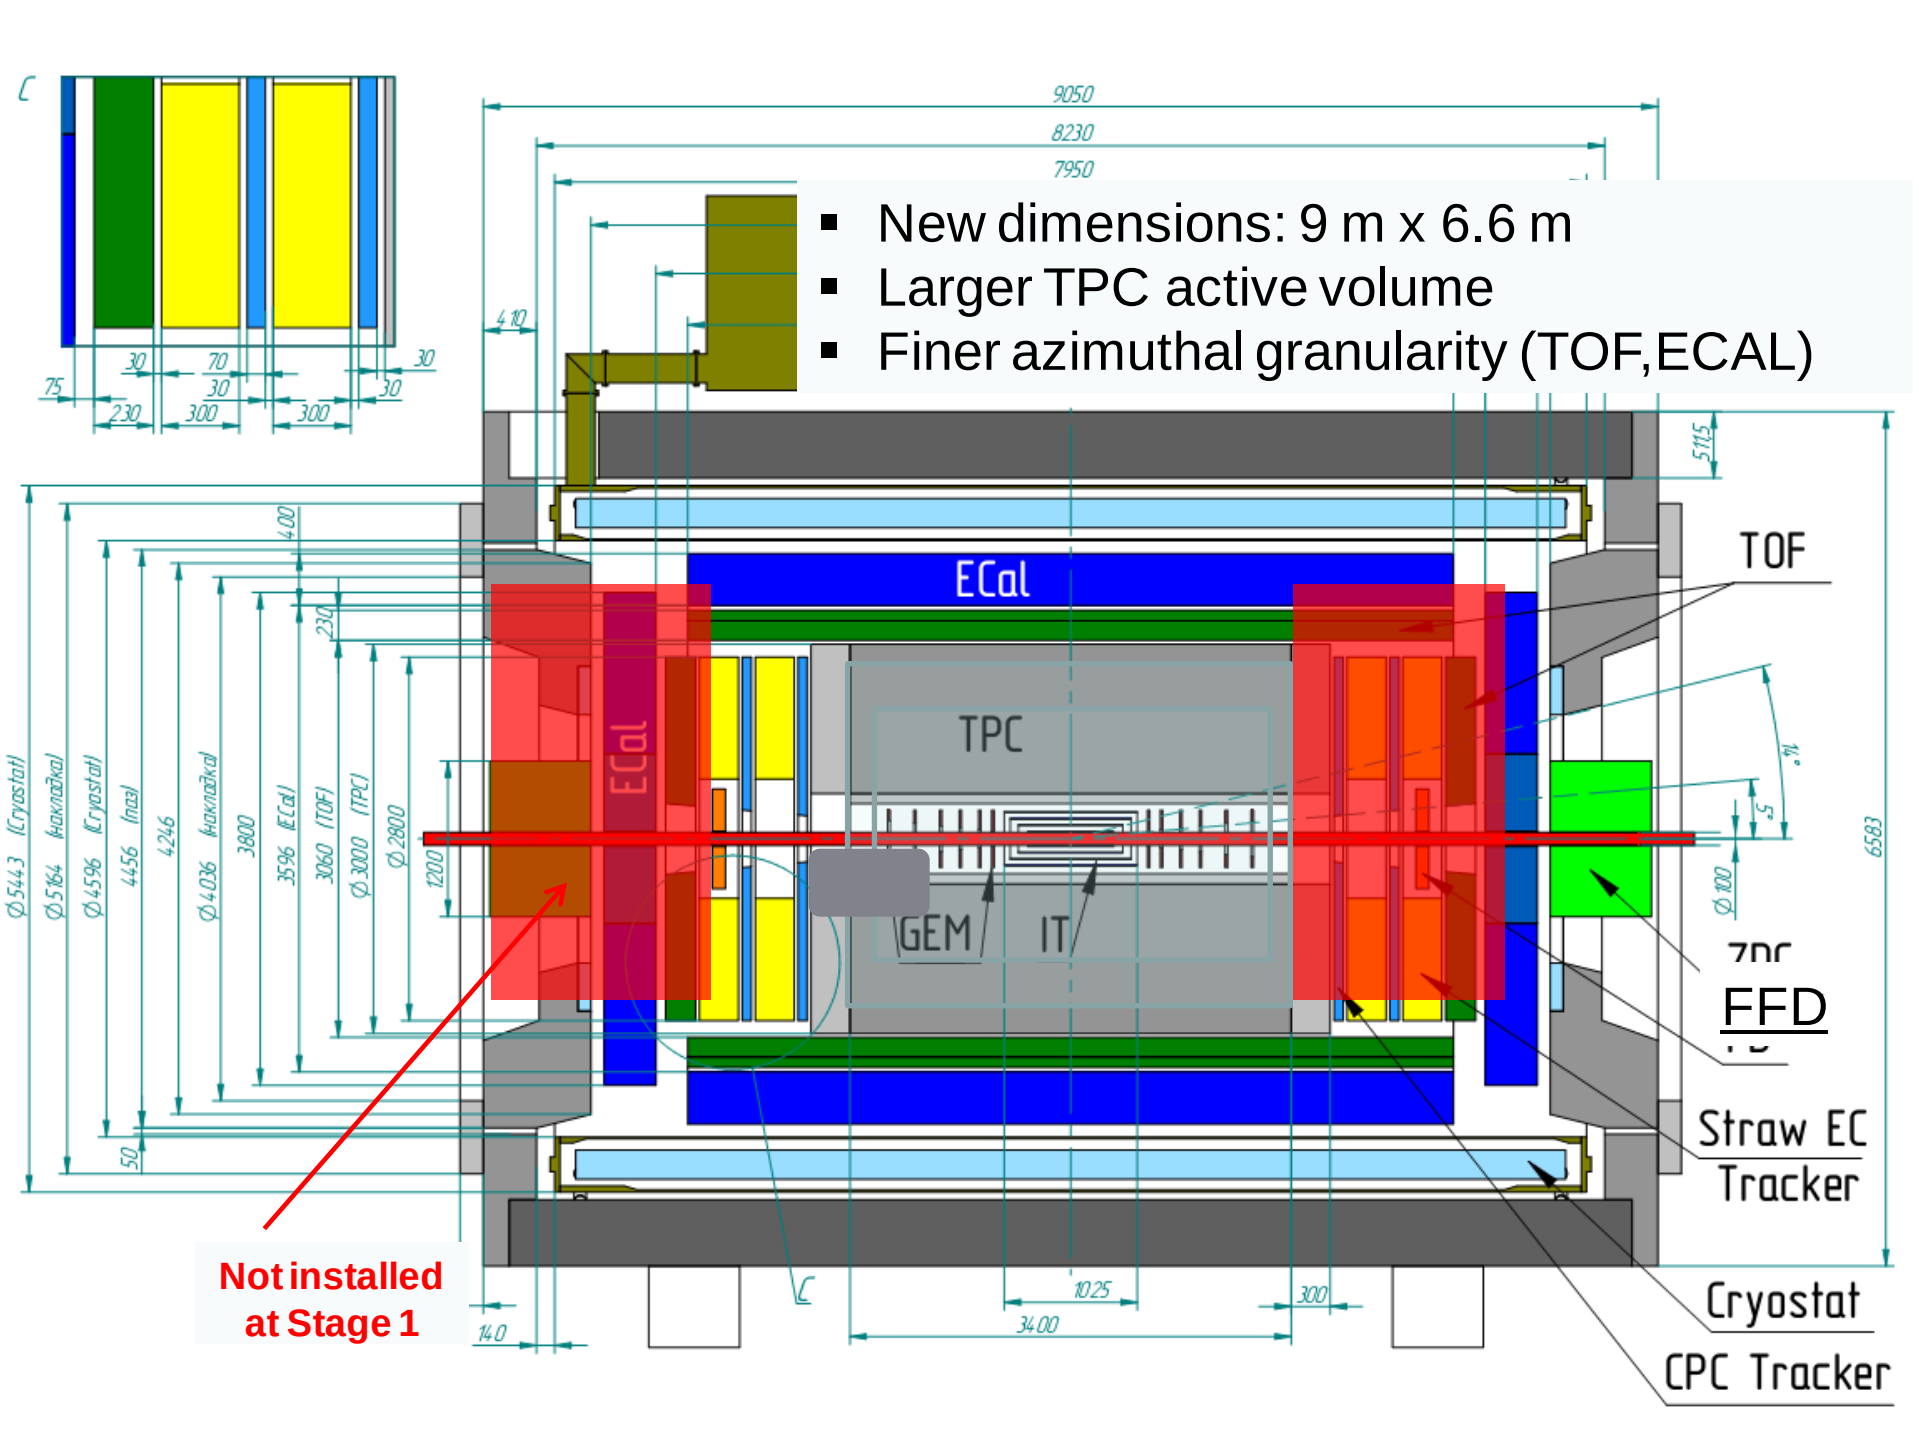
ParticleID : TOF, ECAL, TPC

T0, Triggering : FFD

Centrality, Event plane : ZDC

MPD advantages:

- Hermeticity, homogenous acceptance (2π in azimuth), low material budget
- Good tracking performance and powerful PID (hadrons, e, γ)
- High event rate capability and careful event characterization



New dimensions: 9 m x 6.6 m
Larger TPC active volume
Finer azimuthal granularity (TOF,ECAL)

NICA Physics plan for 2017-19 (Stage 1)

In the beginning energy-system size scan will be performed at NICA-MPD with the listed beam species varying the collisions energy from 4 to 11 GeV in steps of 1-2 GeV.

Beam	Luminosity ($cm^{-2} c^{-1}$)		Data sample per 1 week at $\sqrt{s}$ = 4 GeV
	$\sqrt{s}$=4 GeV	$\sqrt{s}$=11 GeV	
p	10^{32}	10^{32}	$1.5 \cdot 10^{10}$
^{12}C	$4 \cdot 10^{28}$	$2 \cdot 10^{29}$	$1.5 \cdot 10^{10}$
^{64}Cu	$6 \cdot 10^{27}$	$3.5 \cdot 10^{28}$	$5 \cdot 10^{9}$
^{124}Xe	$8 \cdot 10^{26}$	$6 \cdot 10^{27}$	$1 \cdot 10^{9}$
^{197}Au	$1.5 \cdot 10^{26}$	10^{27}	$3 \cdot 10^{8}$

Disk storage for data ≈ 10 PB/year

Measurements of hadrons (π, K, (anti)p, (anti)hyperons, light (anti)nuclei and dilepton spectra as a function of energy, system size, centrality, pT, rapidity and azimuthal angle.

The strategy

- **Localize the QCD CEP, then investigate in detail the critical region (in finer steps)**
- **Detailed study of the LMR dilepton enhancement in the unexplored region of the highest baryon density. If an indication for dropping mass found → detailed look in this region**
- **Study of the QCD mixed phase - hadroproduction and rare probes**

NICA-MPD physics cases

Observable	Set-up	Coverage	New insights
Hadron yields & ratios	TPC, TOF ZDC	$\|\eta\| < 1.5$ pT < 3 GeV/c	Data for $5<\sqrt{s}<7$ GeV, critical assessment of y-spectra and K/π-ratio
Hyperons: yields, flow, Polarization	TPC, TOF ZDC	$\|\eta\| < 1.5$ pT < 3 GeV/c	High statistics data on yields, flow and polarization $\sqrt{s} < 7$ GeV
Dileptons	TPC, TOF ECAL, ZDC	$\|\eta\| < 1.1$ pT < 3 GeV/c	New data at $\sqrt{s} > 5$ GeV
Fluctuations & Correlations	TPC, TOF ECAL, ZDC	$\|\eta\| < 1.5$ pT < 3 GeV/c	New data on Ev-by-Ev fluct. for $\sqrt{s} > 4$ GeV
Anti-protons Anti-nuclei	TPC, TOF ZDC	$\|\eta\| < 1.1$ pT < 2 GeV/c	New data on antinuclei, Flow of Pbar and antiL
Flow (v1,2,3) Hadrons & nuclei	TPC, TOF ZDC	$\|\eta\| < 1.5$ pT< 3 GeV/c	New measurements @ $\sqrt{s}<7$GeV Precise v_n data for ϕ,Ω
Chiral Magnetic & vortical effects	TPC, TOF ZDC	$\|\eta\| < 1.5$ pT < 3 GeV/c	Data @ $\sqrt{s} < 7$GeV (CME) Vortical @ $4 < \sqrt{s} < 11$ GeV
(Hyper)Nuclei	TPC, TOF ZDC	$\|\eta\| < 1.5$ pT< 5 GeV/c	New data at $5 < \sqrt{s} < 11$

Particle yields, Au+Au @ $\sqrt{s_{NN}}$ = 8 GeV *(central collisions)*

Expectations for 10 weeks of running at L = $10^{27}cm^{-2}s^{-1}$ (duty factor = 0.5)

Particle	Yields		Decay mode	BR	*Effic. %	Yield/10 w
	4π	y=0				
π^+	293	97	----	---	61	$2.6 \cdot 10^{11}$
K^+	59	20	---	----	50	$4.3 \cdot 10^{10}$
p	140	41	---	----	60	$1.2 \cdot 10^{11}$
ρ	31	17	e+e-	$4.7 \cdot 10^{-5}$	35	$7.3 \cdot 10^{5}$
ω	20	11	e+e-	$7.1 \cdot 10^{-5}$	35	$7.2 \cdot 10^{5}$
φ	2.6	1.2	e+e-	$3 \cdot 10^{-4}$	35	$1.7 \cdot 10^{5}$
Ω	0.14	0.1	ΛK	0.68	2	$2.7 \cdot 10^{6}$
D^0	$2 \cdot 10^{-3}$	$1.6 \cdot 10^{-3}$	$K^+\pi^-$	0.038	20	$2.2 \cdot 10^{4}$
J/ψ	$8 \cdot 10^{-5}$	$6 \cdot 10^{-5}$	e+e-	0.06	15	10^3

*Efficiency includes the MPD acceptance, realistic tracking and particle ID.
Particle yields are from experimental data (NA49), statistical and HSD models.
Efficiency from MPD simulations. Typical efficiency from published data (STAR)

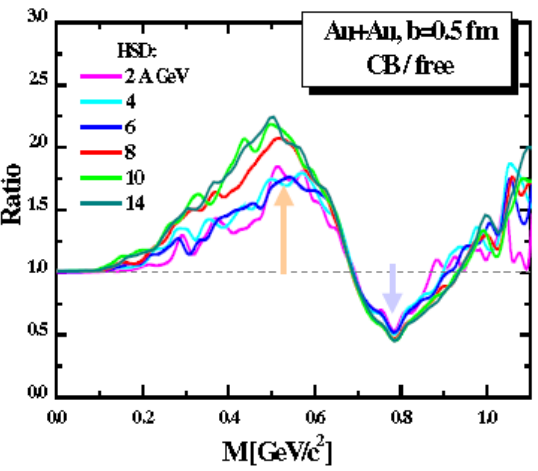
Dileptons. Prospects for NICA

NICA's energy range very well suited to fill an important niche (5<√s<11 GeV):

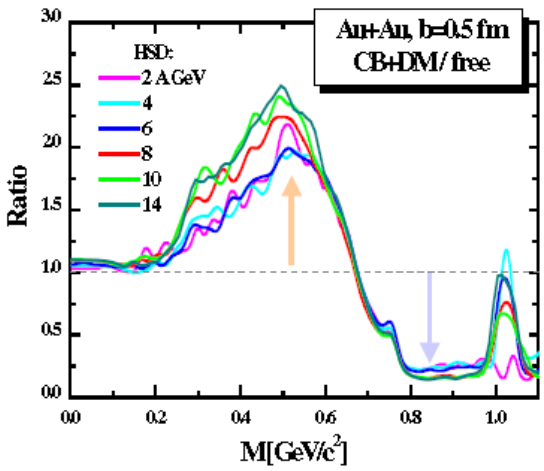
- **Unveil the onset of the low-mass region (LMR) pair enhancement**
- **Study LMR signal under highest baryon density conditions**

E.Bratkovskaya et al.

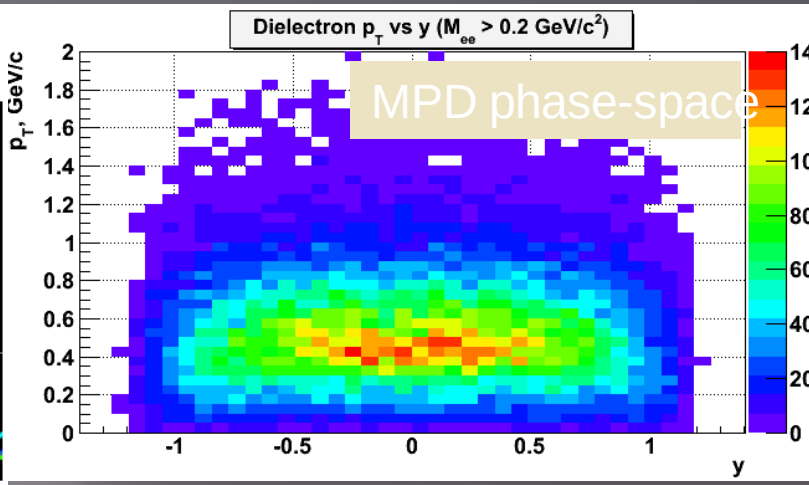
collisional broadening



collisional broadening + dropping mass



❖ **enhancement of dilepton yield for 0.2<M<0.7 GeV and reduction at M~$m_{\rho/\omega}$ for all energies from 2 to 14 A GeV!**



Yields (central Au+Au, √s = 8.8 GeV)

Particle	Yields		Decay mode	BR	Effic. %	Yield/1 w
	4π	y=0				
ρ	31	17	e+e-	$4.7 \cdot 10^{-5}$	35	$7.3 \cdot 10^{4}$
ω	20	11	e+e-	$7.1 \cdot 10^{-5}$	35	$7.2 \cdot 10^{4}$
φ	2.6	1.2	e+e-	$3 \cdot 10^{-4}$	35	$1.7 \cdot 10^{4}$

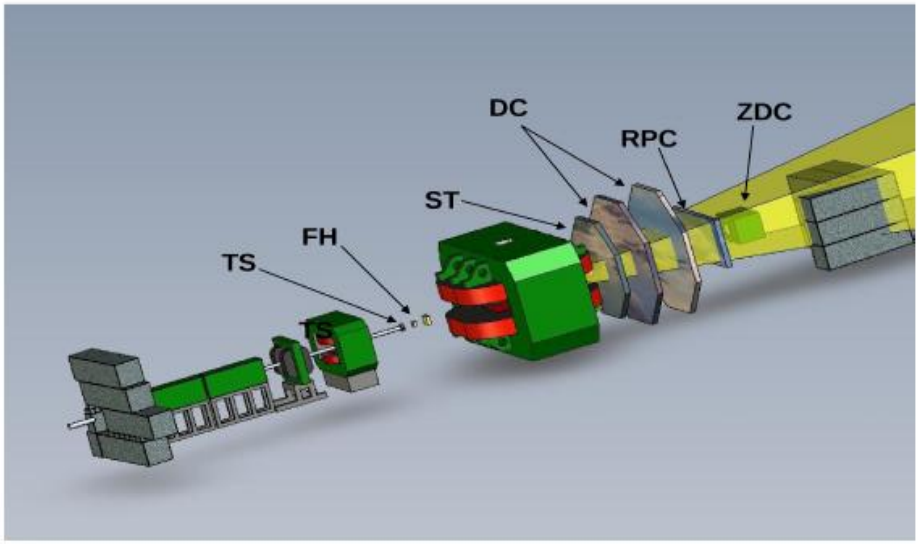
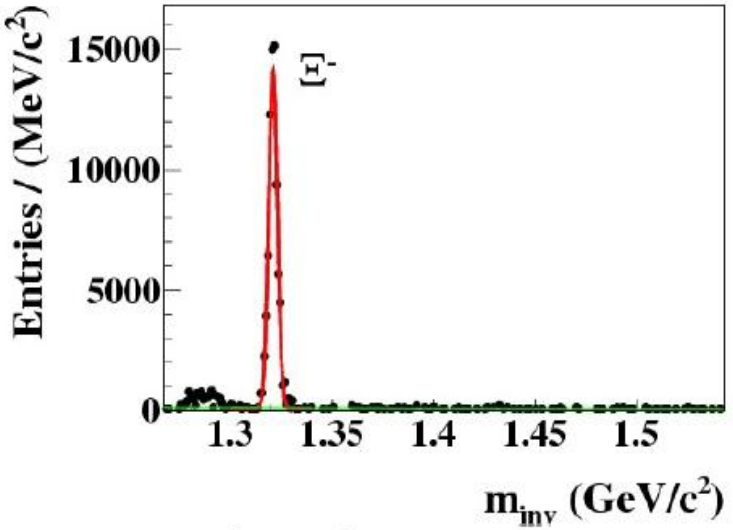
Strange matter production in heavy ion collisions at the Nuclotron extracted beam: Baryonic Matter at Nuclotron(BM@N)

- Collaboration **GSI-JINR** (preparation of the joint experiment has started)
- The goal of the experiment is the systematic measurements of the observables for multistrange objects (Ξ^-, Ω^-, exotics) in Au-Au collisions in the energy domain of the Nuclotron extracted beams (up to 5 A GeV)

Physics at BM@N





Physics for the first stage of the BM@N spectrometer (2015):

-In-medium effects for strangeness and vector mesons decaying in hadron modes
-Flows, polarizations, vorticity and azhimuthal correlations of hadrons
-Femtoscopy for different hadrons (and photons)
-NN and NA interactions as the reference for AA collisions
-Electromagnetic probes (optionally)

Physics for the BM@N spectrometer with inner tracker(2017):

-The measurements of the (sub)threshold cascade hyperons production in order to obtain the information on the nuclear matter EOS.

SPD EXPERIMENT AT NICA

The purpose is study of the nucleon spin structure with high intensity polarized light nuclear beams:

- **high collision proton (deuteron) energy up to $\sqrt{s}$ ~ 26 (13) GeV**
- **the average luminosity > ~ 10^{32} cm^{-2} s^{-1}**
- **both proton and deuteron beams can be effectively polarized.**

The main topics are:

1. **Studies of DY processes with longitudinaly and transversely polarized p and D beams. Extraction of unknown (poorly known) parton distribution functions (PDFs).**
2. **PDFs from J/Ψ production processes.**
3. **Spin effects in baryon, meson and photon productions.**
4. **Studies of spin effects in various exclusive reactions.**
5. **Diffractive processes studies.**
6. **Cross sections, helicity amplidudes and double spin asymmetries (Krisch effect). in elastic reactions.**
7. **Spectroscopy of quarkoniums.**

NICA Spin program plans:

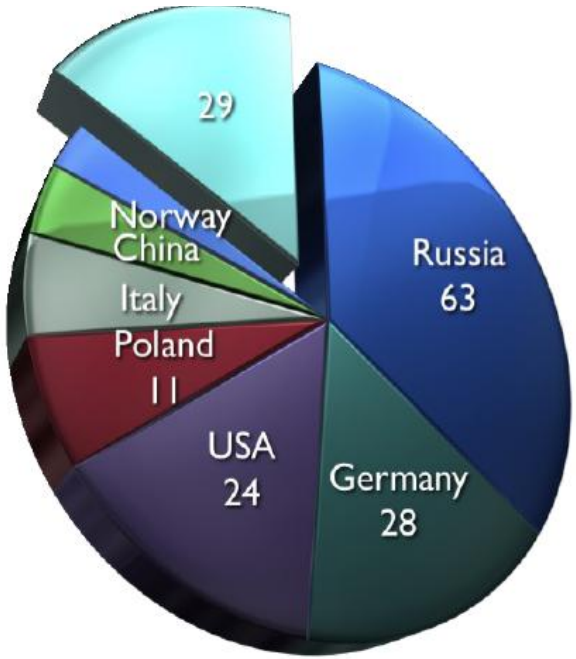
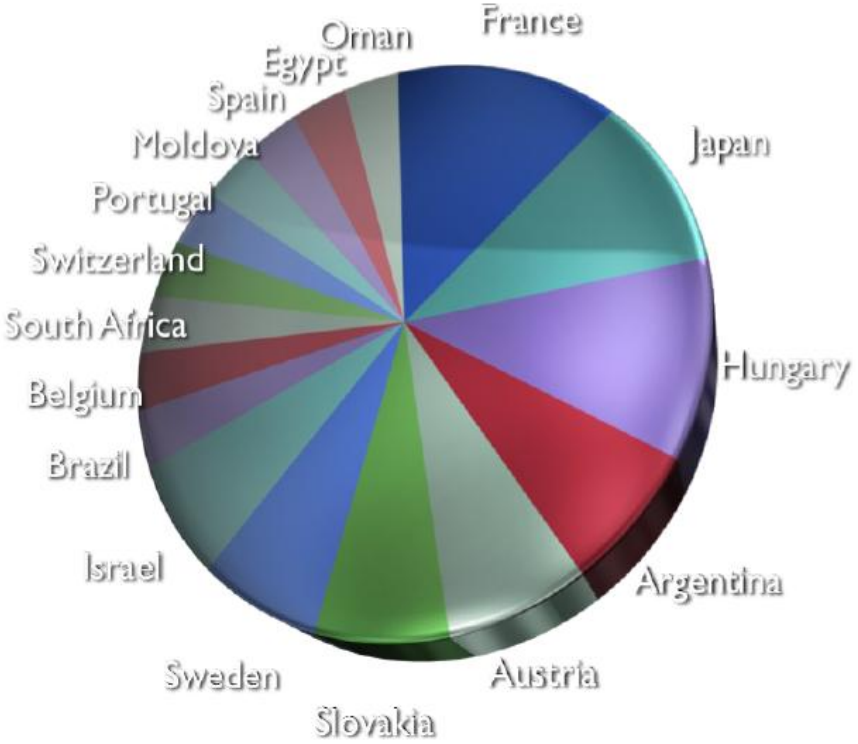
SEARCHING for a QCD MIXED PHASE at the
NUCLOTRON-BASED ION COLLIDER FACILITY
(NICA White Paper)

Statistics of White Paper Contributions

104 contributions:
188 authors from 70 centers in 24 countries



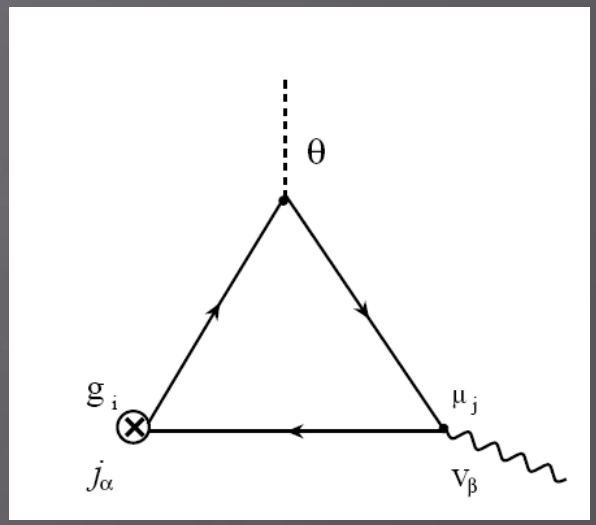


Studying vorticity

- Vorticity for uniform rotation – proportional to Orbital Angular Momentum
- Rotation – another pseudovector – angular velocity
- Tests are required
- Natural object – hydrodynamical helicity (= $v\ rot\ v$)-related to chaos
- Model calculations using DCM (M. Baznat, K. Gudima, A. Sorin, O. Teryaev)

Anomaly in medium – new external lines in VVA graph

- Gauge field -> velocity
- CME -> CVE
- Kharzeev, Zhitnitsky (07) – EM current
- Generalization: any (e.g. baryonic) current – neutron asymmeries@NICA
  O. Rogachevsky, A. Sorin, O. Teryaev
  PRC82:054910,2010



Coupling: $e_j A_\alpha J^\alpha \Rightarrow \mu_j V_\alpha J^\alpha$

Current: $J_e^\gamma = \frac{N_c}{4\pi^2 N_f} \varepsilon^{\gamma\beta\alpha\rho} \partial_\alpha V_\rho \partial_\beta (\theta \sum_j e_j \mu_j)$

Observable: three-particle correlator: $\langle cos(\phi_\alpha + \phi_\beta - 2\phi_c) \rangle$

CME@RHIC: 15 M events to establish the effect.
CVE@NICA:1000 M events, which can be collected within a few months of the NICA run.

Helicity separation in Heavy-Ion Collisions

NICA/JINR-FAIR Bilateral Workshop

Matter at Highest Baryon Densities in the Laboratory and in Space

Frankfurt Institute for Advanced Studies, April 2 - 4, 2012

http://theor.jinr.ru/~nica_fair/

Topics:

- Phases of QCD at high baryon densities
- Effects signalling phase transitions
- Observables in heavy-ion collisions and in astrophysics
- Simulations of ion collisions and supernovae

Aims:

- identify discovery potential of Nuclotron-NICA and FAIR in the canon of current and future HIC experiments
- chiral symmetry restoration
- onset of deconfinement
- in-medium modification of hadron properties
- color superconductivity, multiquark states, etc.

Results:

- Most promising and feasible suggestions for experiments at Nuclotron-NICA and CBM/FAIR
- Priorities for detectors and formation of international collaborations

between

GESELLSCHAFT FÜR SCHWERIONENFORSCHUNG mbH (GSI, Darmstadt)

and

JOINT INSTITUTE FOR NUCLEAR RESEARCH (JINR, Dubna)

Conclusions of the Town Meeting at CERN, 29 June 2012

On a time scale of less than a decade, using the existing heavy ion beams at the Nuclotron accelerator, the NICA project at JINR in Dubna will provide a similar energy range in a collider geometry at the average luminosity of 10^{27} / cm2 s, as well as, the fixed target experiments with ELab = 2 – 4.5 GeV/nucleon.

This offers important complementarities to the beam energy scan program at RHIC and the programs at FAIR.

The Open Symposium on European Strategy in Particle Physics *(11-12 Sept., Krakow, PL)*

indicated the NICA facility as a part of HI European program

The NICA beam users community

the Workshop "Prospect for experimental research on the Nuclotron beams“ ***held on 6-7 June at VBLHEP, JINR***

The Workshop was organized in order to make the scientific community informed about:

- ***status of the existing Nuclotron facility & the reached beam parameters;***
- ***possibility of further development & usage of these beams for research;***
- ***available supporting infrastructure & possibility of its development;***
- ***agreed policy and rules of usage of the beams.***

Experts from the EC visited the Ministry of Education & Science *(Moscow, May 16)* and JINR *(Dubna, May 17)*

visit of the EC experts to JINR, May 17, 2013

Discussion on the NICA project

PROTOCOL

of the International Meeting on Prospects for Collaboration in the Mega-Science Project "Complex of Superconducting Rings for Heavy Ion Colliding Beams" — the NICA Complex

Dubna, 8 August 2013

1. The Participants of the Meeting representing:

- the State Committee of Science and Technology of the Republic of Belarus;
- the Nuclear Regulatory Agency of the Republic of Bulgaria;
- the Federal Ministry of Education and Research (BMBF) of the Federal Republic of Germany;
- the Atomic Energy Committee of the Ministry of Industry and New Technologies of the Republic of Kazakhstan;
- the Ministry of Education and Science of the Russian Federation;
- the State Agency for Science, Innovation and Informatization of Ukraine;
- the Joint Institute for Nuclear Research (JINR), an international research organization,

■ ■ ■

3. The Parties express their positive opinion about the joint efforts within the Collaboration aimed at construction and use of the NICA Complex facility.

■ ■ ■

RF Prime Minister V.V. Putin at NICA, July 5, 2011

Session of the Government Commission on High Technology and Innovation (Dubna, July 5, 2011)

Prior to the session, the Ministry of Education and Science of the Russian Federation, jointly with the interagency working group, selected 6 out of 28 submitted applications which meet the highest requirements imposed to specify the class of "mega-science" facilities. Among them is the NICA project.

The meeting of the Working Group of the Russian Ministry of Education and Science (Moscow, January 17, 2012)

The NICA project has passed the international expertise that is a precondition for funding, along with two other megaprojects – the PIK reactor and the IGNITOR tokamak.

NICA is in the approved Russian mega-science program

ПРАВИТЕЛЬСТВО РОССИЙСКОЙ ФЕДЕРАЦИИ

РАСПОРЯЖЕНИЕ

от 20 декабря 2012 г. № 2433-р

МОСКВА

1. Утвердить государственную программу Российской Федерации "Развитие науки и технологий".

2. Минобрнауки России разместить государственную программу Российской Федерации "Развитие науки и технологий" на своем официальном сайте, а также на портале государственных программ Российской Федерации в информационно-телекоммуникационной сети "Интернет" в 2-недельный срок со дня официального опубликования настоящего распоряжения.

Председатель Правительства Российской Федерации Д.Медведев

Государственная программа Российской Федерации "Развитие науки и технологий" на 2013 – 2020 годы

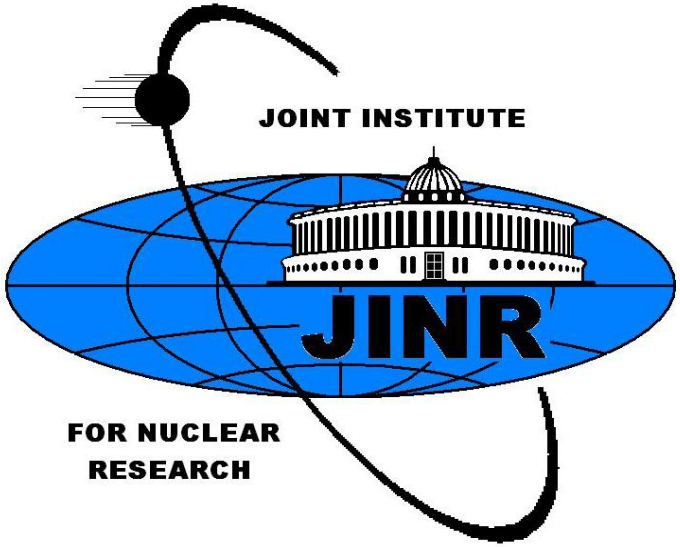
Предусматривается создание комплекса сверхпроводящих колец на встречных пучках тяжелых ионов NICA. В результате реализации проекта будет создан уникальный ускорительный комплекс, который позволит развернуть программу фундаментальных научных исследований в области физики элементарных частиц с недоступными на сегодняшний день энергиями и массами взаимодействующих частиц. Будут получены новые знания о фундаментальной структуре и свойствах материи.

Concluding Remarks

- The NICA complex is well developing
- The two physics projects BM@N & MPD are targeting to the HI physics frontiers
- The NICA program is well integrated into world experimental HI facilities
- The SP program is developing, but could started already at MPD
- The collaborations are growing around NICA & are getting an international recognition
- You are welcome to enlarge the participation in the NICA program

Thank you

Welcome to the collaboration!



Thank you for attention!

Heaviest Magnet

The heaviest magnet is one measuring 196 ft in diameter, with a weight of 40,000 tons, for the 10 GeV synchrophasotron in the Joint Institute for Nuclear Research at Dubna, near Moscow.

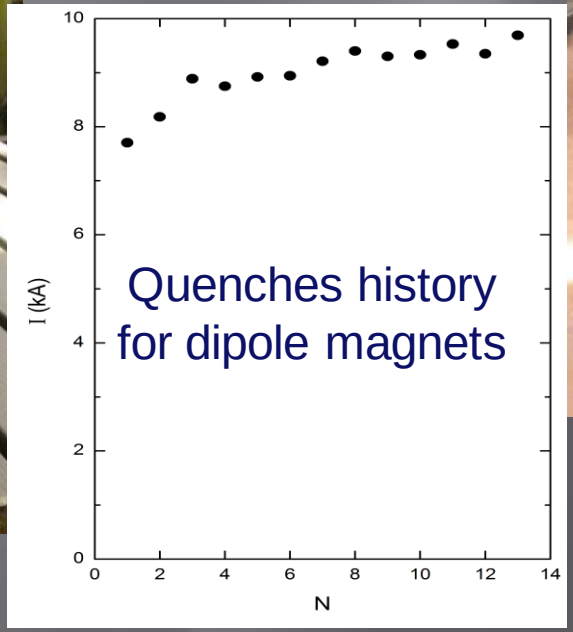
SC magnet production for NICA *(booster, collider)* & FAIR

Dipole magnet in cryostat

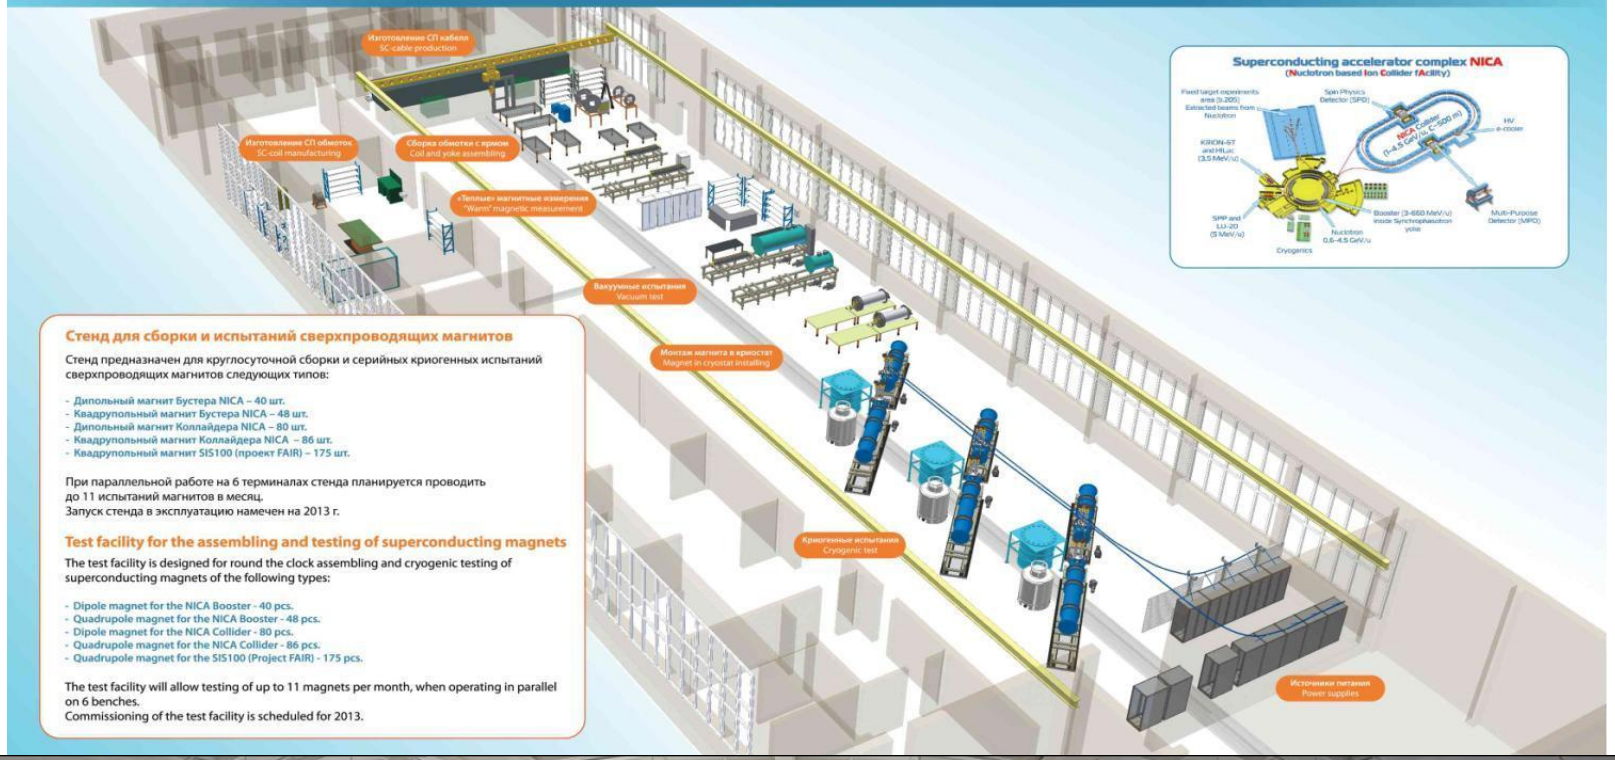
yoke of quadrupole lens after final treatment

Dipole magnet for collider

Prototype of curved dipole



СТЕНД ДЛЯ СБОРКИ И ИСПЫТАНИЙ СВЕРХПРОВОДЯЩИХ МАГНИТОВ
TEST FACILITY FOR THE ASSEMBLING AND TESTING OF SUPERCONDUCTING MAGNETS



Стенд для сборки и испытаний сверхпроводящих магнитов

Стенд предназначен для круглосуточной сборки и серийных криогенных испытаний сверхпроводящих магнитов следующих типов:

- Дипольный магнит Бустера NICA – 40 шт.
- Квадрупольный магнит Бустера NICA – 48 шт.
- Дипольный магнит Коллайдера NICA – 80 шт.
- Квадрупольный магнит Коллайдера NICA – 86 шт.
- Квадрупольный магнит SIS100 (проект FAIR) – 175 шт.

При параллельной работе на 6 терминалах стенда планируется проводить до 11 испытаний магнитов в месяц.
Запуск стенда в эксплуатацию намечен на 2013 г.

Test facility for the assembling and testing of superconducting magnets

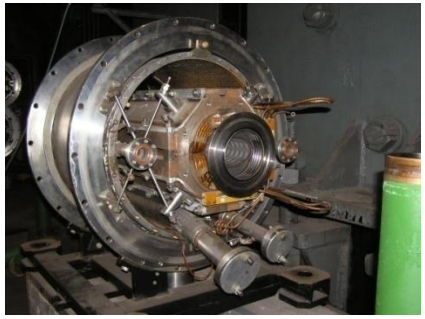
The test facility is designed for round the clock assembling and cryogenic testing of superconducting magnets of the following types:

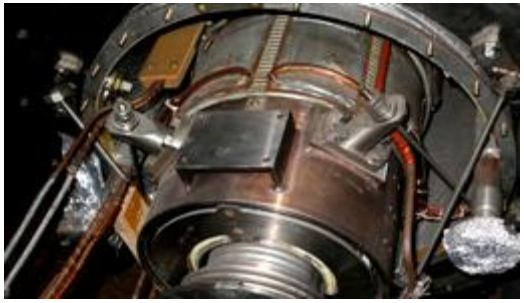
- Dipole magnet for the NICA Booster - 40 pcs.
- Quadrupole magnet for the NICA Booster - 48 pcs.
- Dipole magnet for the NICA Collider - 80 pcs.
- Quadrupole magnet for the NICA Collider - 86 pcs.
- Quadrupole magnet for the SIS100 (Project FAIR) - 175 pcs.

The test facility will allow testing of up to 11 magnets per month, when operating in parallel on 6 benches.
Commissioning of the test facility is scheduled for 2013.

The building is ready for the equipment installation

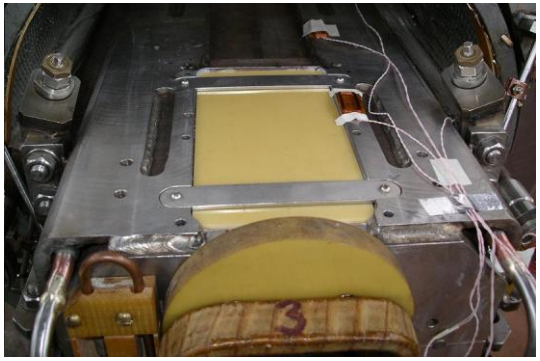
Constructing and Testing JINR Experience





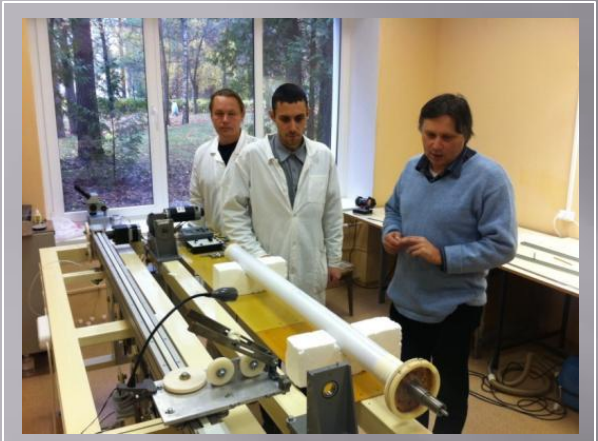
160 SC dipole and quadrupole magnets for the Nuclotron: construction, test and operation since1993.

26 model magnets for SIS100



SIS100 prototype dipole and prototype quadrupole magnets

Modern SC technologies + unique accelerator physics at JINR



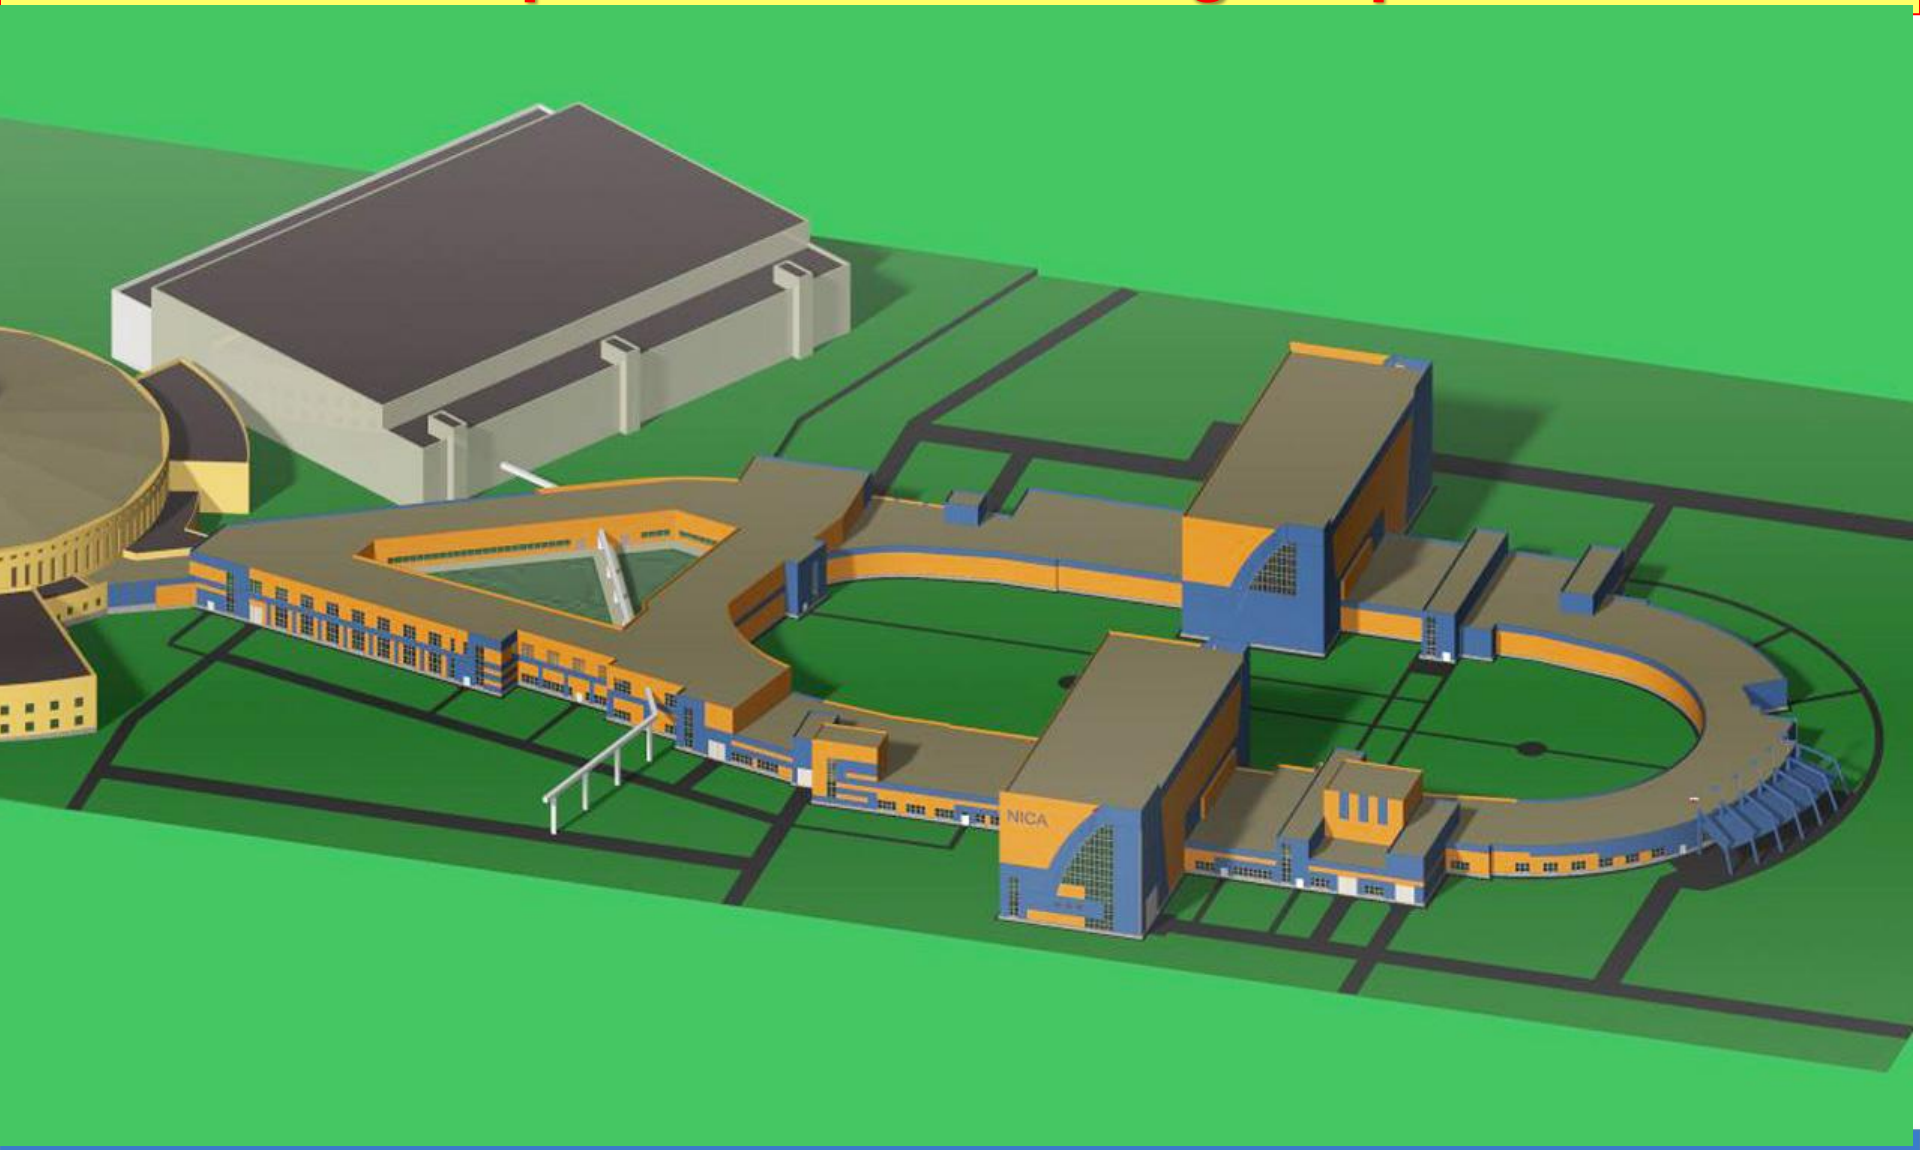
Highly charged ion state for heavy ions with high intensity, e.g., Kr 28+, Xe 44+, Au 65+..32+

Quadrupole and curved Dipole magnet for booster

Dipole magnet for NICA collider

New Source of Polarized Ions (≤10 mA *for* $\uparrow D^+$ ($\uparrow H^+$)) assembled and first test has been started.

NICA complex technical design report status



Geological, geodetical, topography measurements and drillings had been fulfilled and analyzed. Technological part of the TDR (main equipment, engineering systems, etc), radiation and environmental safety, architecture had been fulfilled. Now – the final stage: capital spending sights. Plan – to submit all documents to the State Expertise – end of 2012

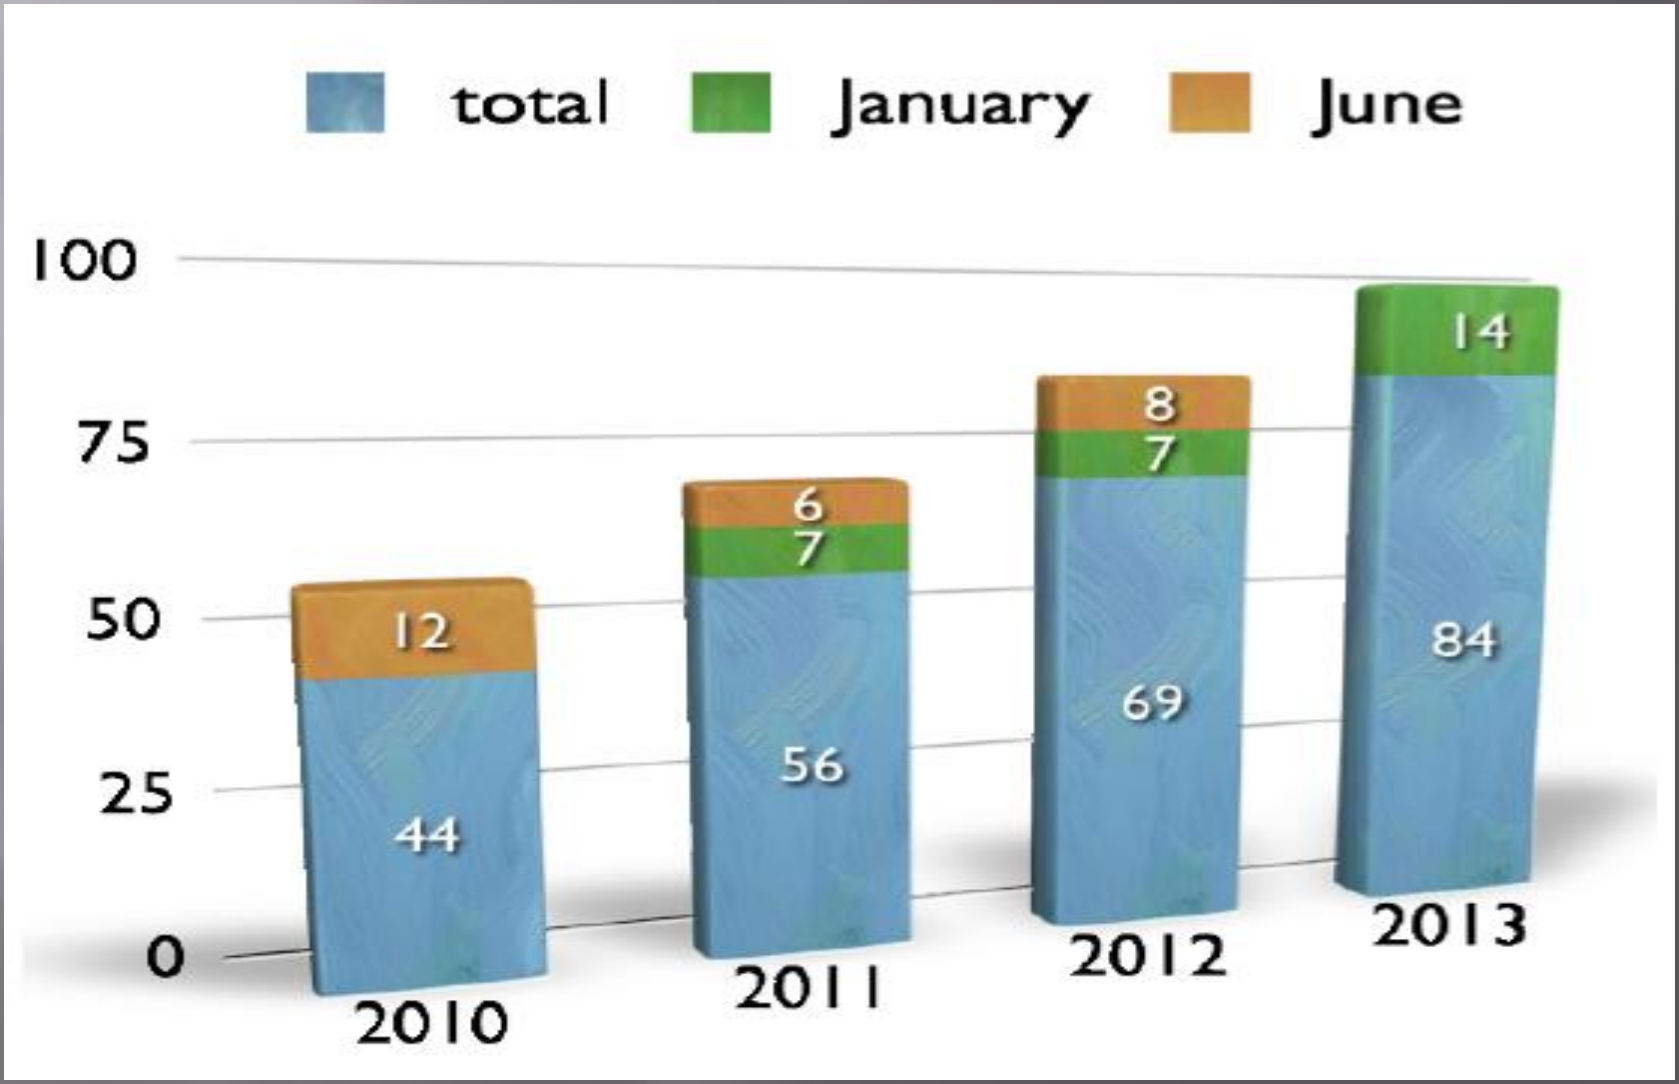
Statistics of White Paper Contributions



Experiments on superdense nuclear matter

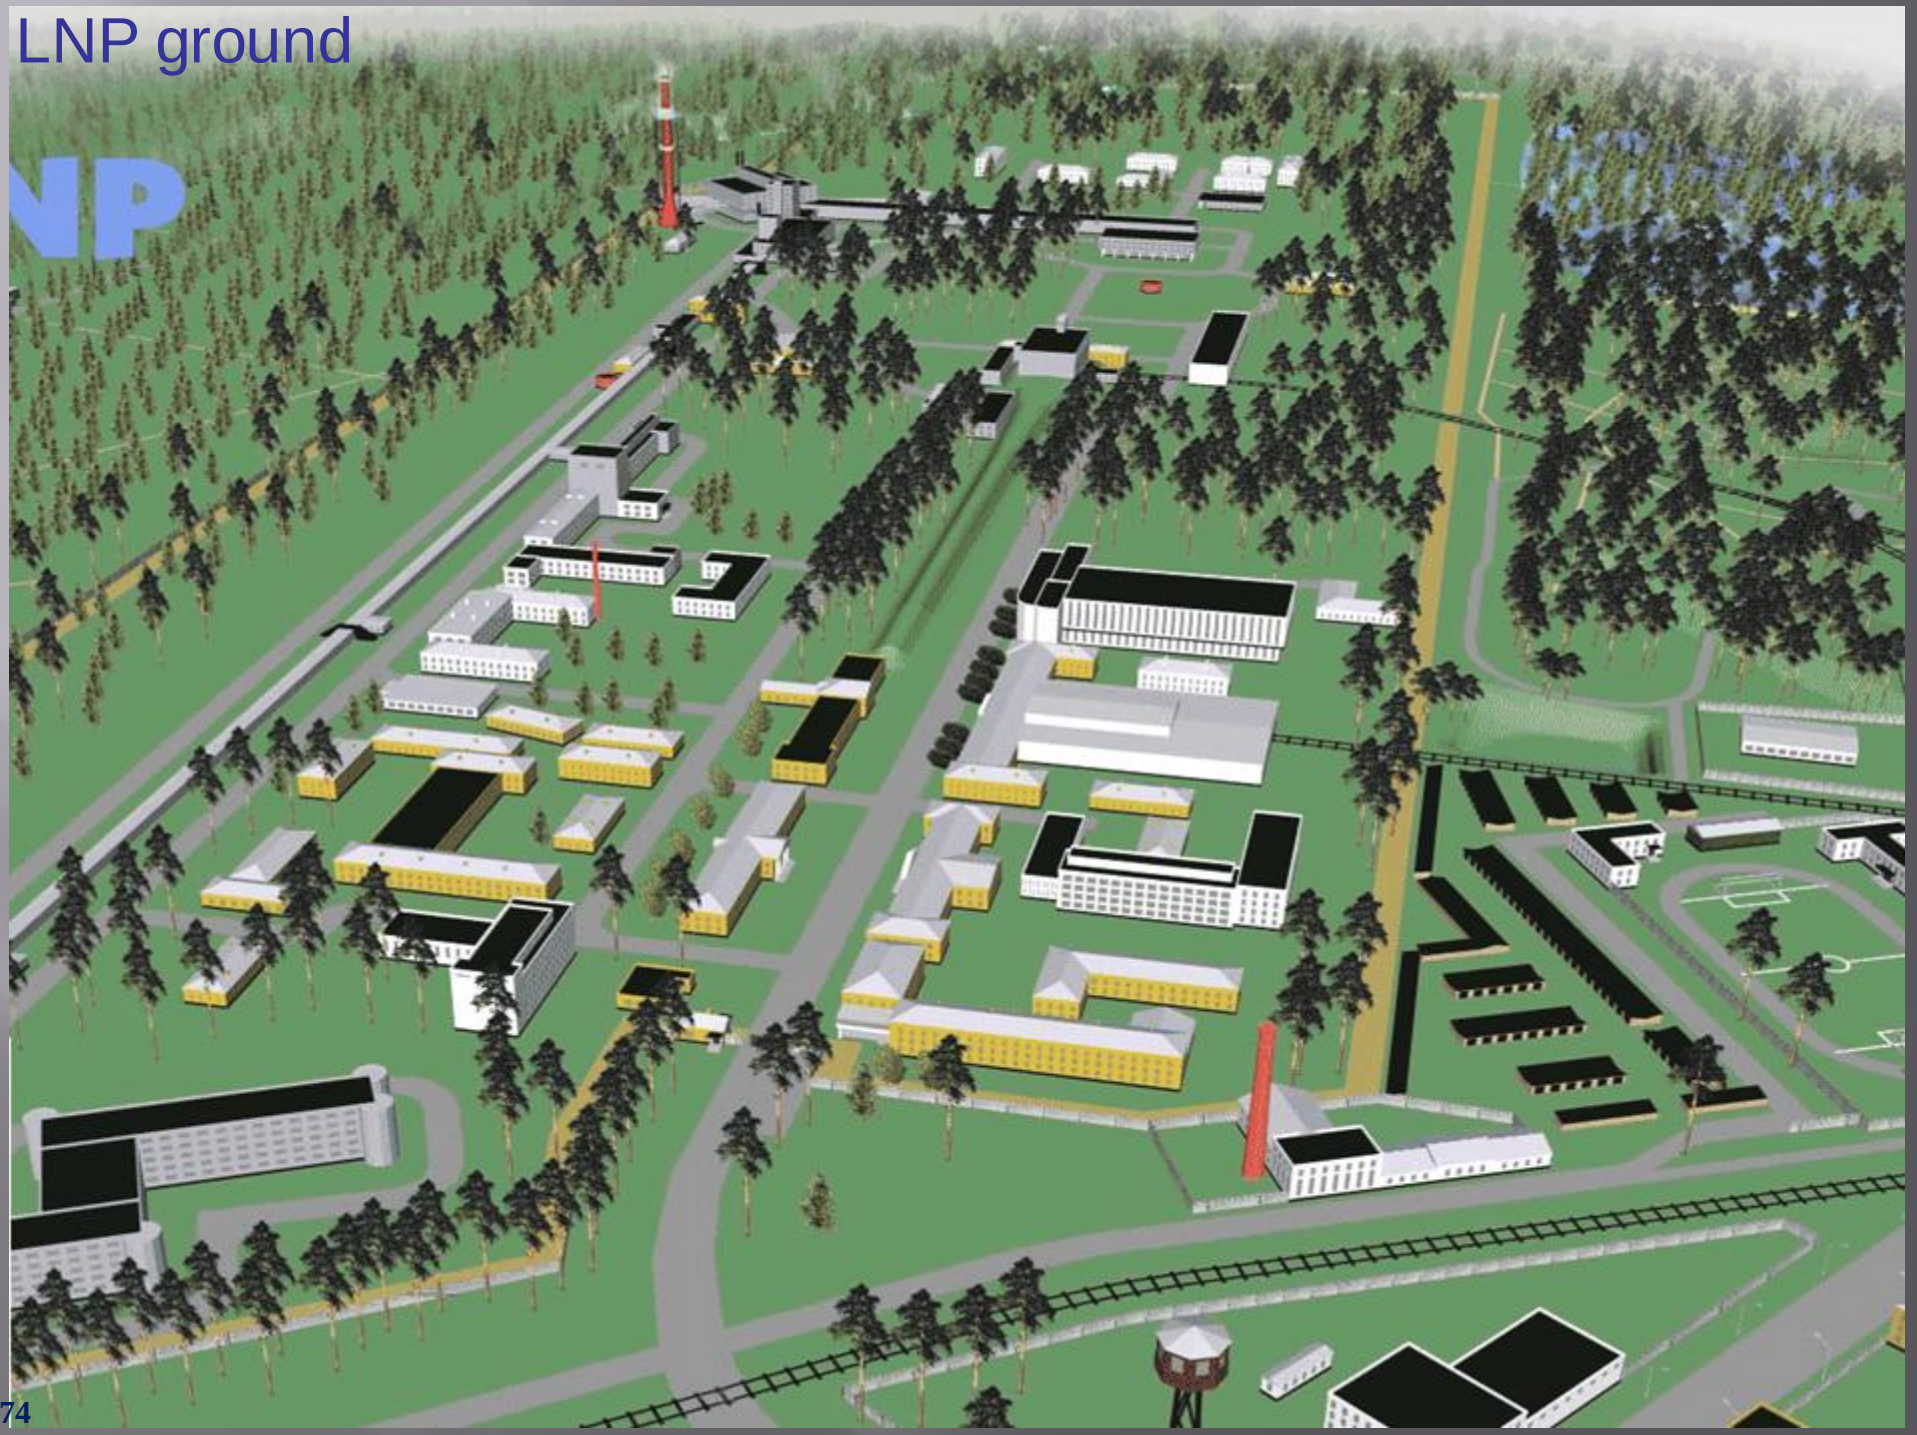
Experiments	Energy range (Au/Pb beams)	Reaction rates Hz
STAR@RHIC BNL	$\sqrt{s_{NN}}$ = 7 – 200 GeV	1 – 800 (limitation by luminosity)
NA61@SPS CERN	E_{kin} = 20 – 160 A GeV $\sqrt{s_{NN}}$ = 6.4 – 17.4 GeV	80 (limitation by detector)
MPD@NICA Dubna	$\sqrt{s_{NN}}$ = 4.0 – 11.0 GeV	~7000 (design luminosity of 10^{27} $cm^{-2}s^{-1}$ for heavy ions)
CBM@FAIR Darmstadt	E_{kin} = 2.0 – 35 A GeV $\sqrt{s_{NN}}$ = 2.7 – 8.3 GeV	10^5 – 10^7 (limitation by detector)

Experiments on superdense nuclear matter

Experiments	Observables for high baryon density region			
	hadrons	correlations, fluctuations with high statistics	dileptons	charm
STAR@RHIC BNL	yes	no	no	no
NA61@SPS CERN	yes	no	no	no
MPD@NICA Dubna	yes	yes	yes	no
CBM@FAIR Darmstadt	yes	yes	yes	yes

Advantage of collider experiments:
Uniform phase-space coverage when measuring excitation functions.

LNP ground



The goal of the BM@N experiment

I. Heavy-ion collisions *A+A* - study of the properties of dense nuclear (dominantly baryonic) matter with strangeness :

- production mechanisms and modifications of hadron properties in dense nuclear matter – ‚in-medium effects'

  Probes: strange mesons, strange and multi-strange baryons;
  vector mesons via hadronic mode (dilepton/photon mode – perspectives)

- study of the EoS with strangeness

- hypermatter production:
  search for light hypernuclei and multi-strange meta-stable objects

II. Study of elementary reactions: *p+p, p+n(d)*

III. Study of ‚cold' nuclear matter: physics with *p+A*

Observables

Way to study:

Experimental energy scan of differential observables in comparison with theory

Observables:

- **Excitation function of particle yields and ratios**
- **Transverse mass m_T- and momentum p_T- spectra**
- **Rapidity distributions**
- **Collective flow - anisotropy coefficients (v_1, v_2, v_3, v_4)**
- **Fluctuations**
- **Correlations**
