Networking Tools for Sysadmins

Friday 19 October 2012 11:30 (30 minutes)

The talk wants to introduce netdisco, which is used at DESY for network inventory and has been enhanced slightly. A command line interface for the netdisco DB developed at DESY should be covered as well.

The concept of using netflow data to understand and analyze network traffic should be discussed, which is especially suitable for sites with high traffic. Programs that can deal with netflow data, such as the recently released version 5 of ntop, nfdump to record netflows and nfsen to visualize the data will be presented, as well as some plugins for nfsen.

All the tools covered in the talk are IPv6 enabled.
