Conclusions
○

Jet Charge

- ▶ Motivation: separate q and \bar{q} jets, flavor tag

$$Q_\kappa = \sum_{h \in \text{jet}} \left(\frac{p_T^h}{p_T^{\text{jet}}} \right)^\kappa Q_h$$

[Feynman, Field (1977)]

Conclusions
○

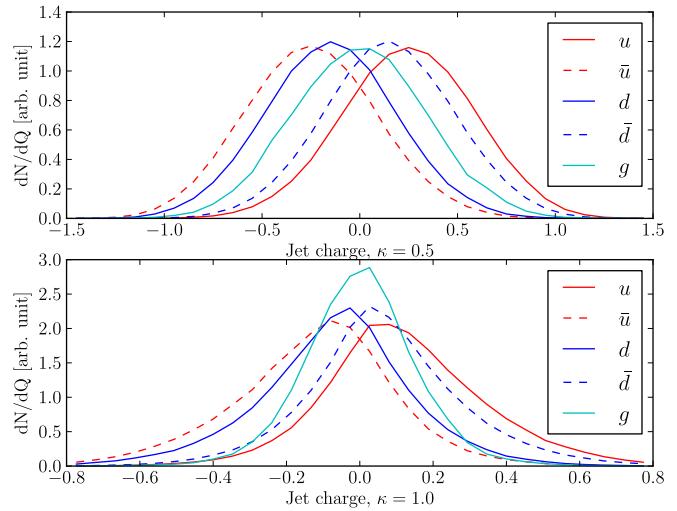

Jet Charge

- ▶ Motivation: separate q and \bar{q} jets, flavor tag

$$Q_\kappa = \sum_{h \in \text{jet}} \left(\frac{\mathbf{p}_T^h}{\mathbf{p}_T^{\text{jet}}} \right)^\kappa Q_h$$

[Feynman, Field (1977)]

- ▶ κ too small: measurement sensitive to soft hadrons → contamination
- ▶ κ too large: need more statistics to separate flavors

Introduction

Track-Based Observables
○○○○○○○○○○

Conclusions
○

LHC Application: W' vs. Z'

- ▶ Hadronically decaying W' and Z' with mass 1 TeV
- ▶ Likelihood discriminant based on charge of both jets
- ▶ With 50 events $\sim 4\sigma$ separation

Introduction
○○○●○

Calculation
○○○○○

Comparison with PYTHIA

Track-Based Observables
○○○○○○○○○○

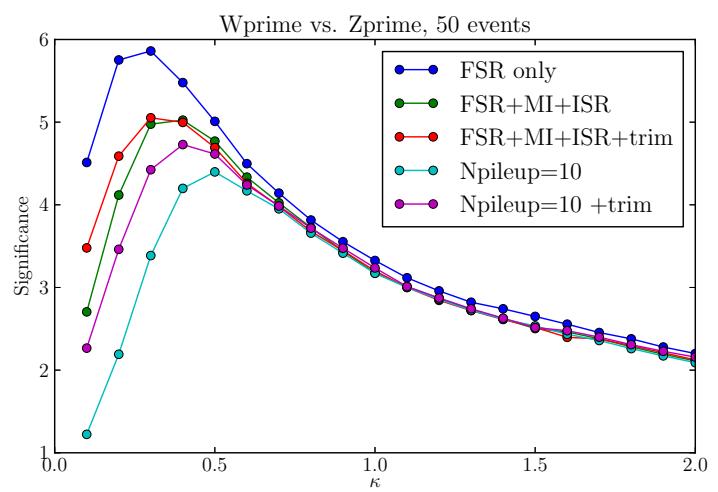

Conclusions
○

LHC Challenges

Contamination:

- ▶ Initial-state radiation (ISR)
- ▶ Multi-parton interactions (MI)
- ▶ Pile-up

Soft effects → issue for small κ

Introduction

Calculation
○●○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Average Jet Charge

Jet with energy E and radius R : [Using Ellis, Hornig, Lee, Vermilion and Walsh (2010)]

$$\langle Q_\kappa^q \rangle = \sum_h \int dz z^\kappa Q_h \frac{1}{\sigma_{\text{jet}}} \frac{d\sigma_{h \in \text{jet}}}{dz} = \sum_h \int dz z^\kappa Q_h \frac{\mathcal{G}_q^h(ER, z, \mu)}{J_q(ER, \mu)}$$

- ▶ Dependence on hard collision, soft radiation and other jets suppressed

Introduction
○○○○○

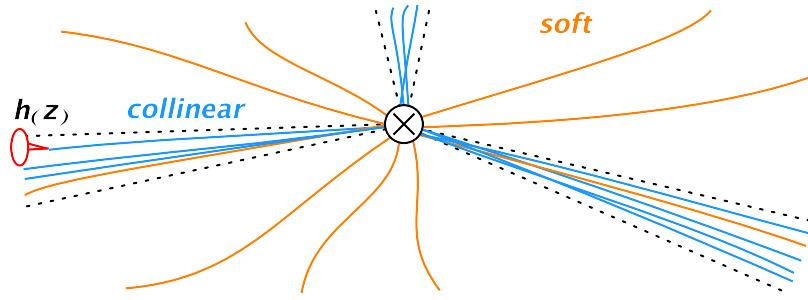

Calculation
○●○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Average Jet Charge

Jet with energy \mathbf{E} and radius \mathbf{R} : [Using Ellis, Hornig, Lee, Vermilion and Walsh (2010)]

$$\langle Q_\kappa^q \rangle = \sum_h \int dz z^\kappa Q_h \frac{1}{\sigma_{\text{jet}}} \frac{d\sigma_{h \in \text{jet}}}{dz} = \sum_h \int dz z^\kappa Q_h \frac{\mathcal{G}_q^h(\mathbf{ER}, z, \mu)}{J_q(\mathbf{ER}, \mu)}$$

- ▶ Dependence on hard collision, soft radiation and other jets suppressed
- ▶ Dependence on perturbative \mathbf{ER} calculable:

$$\mathcal{G}_i^h(\mathbf{ER}, z, \mu) = \sum_j \int_z^1 \frac{dx}{x} \mathcal{J}_{ij}(\mathbf{ER}, x, \mu) D_j^h\left(\frac{z}{x}, \mu\right)$$

[Procura, Stewart (2010), Jain, Procura, WW (2011)]

- ▶ μ -dependence cancels between \mathcal{G}_q^h and J_q
- ▶ Evaluate at jet scale $\mu \sim \mathbf{ER}$ to avoid large logs

Introduction
○○○○○

Calculation
○○●○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Interpretation

- ▶ At leading order:

$$\langle Q_\kappa^q \rangle = 1 \times \sum_h Q_h \tilde{D}_q^h(\kappa, \mu = ER)$$

Introduction
○○○○○

Calculation
○○●○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Interpretation

- ▶ At leading order:

$$\langle Q_\kappa^q \rangle = 1 \times \sum_h Q_h \tilde{D}_q^h(\kappa, \mu = ER)$$

- ▶ ER dependence from moment-space evolution:

$$\mu \frac{d}{d\mu} \tilde{D}_i^h(\kappa, \mu) = \sum_j \frac{\alpha_s(\mu)}{\pi} \tilde{P}_{ji}(\kappa) \tilde{D}_j^h(\kappa, \mu),$$

- ▶ Mixing into gluons will vanish, since $D_g^{h+} - D_g^{h-} = 0$

Introduction
○○○○○

Calculation
○○●○○

Comparison with PYTHIA

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Interpretation

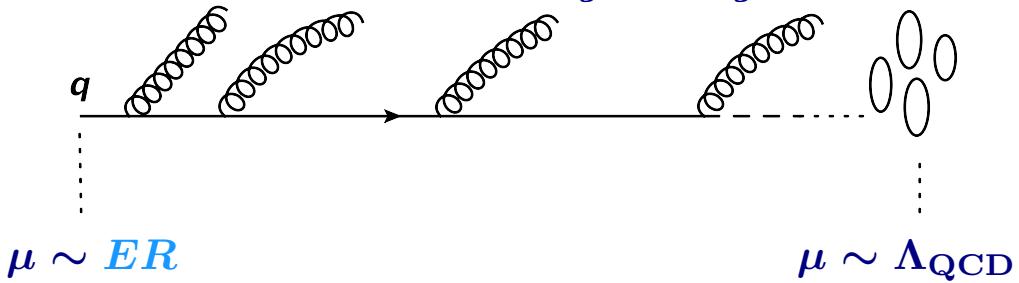

- ▶ At leading order:

$$\langle Q_\kappa^q \rangle = 1 \times \sum_h Q_h \tilde{D}_q^h(\kappa, \mu = ER)$$

- ▶ ER dependence from moment-space evolution:

$$\mu \frac{d}{d\mu} \tilde{D}_i^h(\kappa, \mu) = \sum_j \frac{\alpha_s(\mu)}{\pi} \tilde{P}_{ji}(\kappa) \tilde{D}_j^h(\kappa, \mu),$$

- ▶ Mixing into gluons will vanish, since $D_g^{h+} - D_g^{h-} = 0$

- ▶ Showering starts at jet scale not hard scale

Introduction
○○○○○

Calculation
○○●○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Interpretation

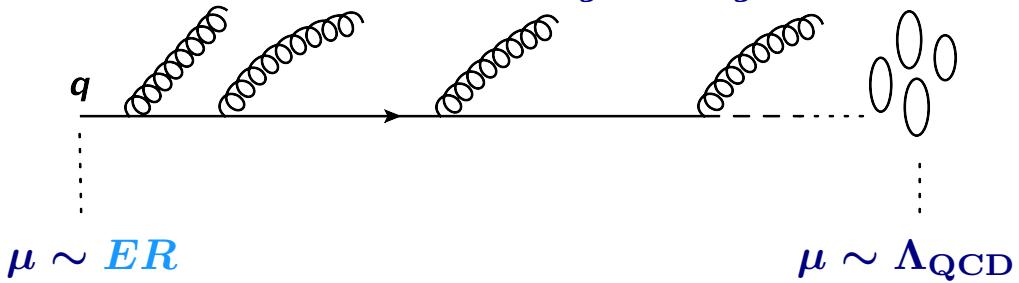

- ▶ At next-to-leading order:

$$\langle Q_\kappa^q \rangle = \tilde{\mathcal{J}}_{qq}(ER, \kappa, \mu = ER) \sum_h Q_h \tilde{D}_q^h(\kappa, \mu = ER)$$

- ▶ ER dependence from moment-space evolution:

$$\mu \frac{d}{d\mu} \tilde{D}_i^h(\kappa, \mu) = \sum_j \frac{\alpha_s(\mu)}{\pi} \tilde{P}_{ji}(\kappa) \tilde{D}_j^h(\kappa, \mu),$$

- ▶ Mixing into gluons will vanish, since $D_g^{h+} - D_g^{h-} = 0$

- ▶ Showering starts at **jet scale** not hard scale
- ▶ Perturbative splittings at beginning of shower

○

Comparison with Fragmentation Functions

$$\langle Q_\kappa^q \rangle = \tilde{\mathcal{J}}_{qq}(ER, \kappa, \mu = ER) \sum_h Q_h \tilde{D}_q^h(\kappa, \mu = ER)$$

Average jet charge for $E = 100$ GeV and $R = 0.5$:

κ	<i>u</i> -quark			<i>d</i> -quark		
	PYTHIA	DSS	AKK08	PYTHIA	DSS	AKK08
0.5	0.271	0.237	0.221	-0.162	-0.184	-0.062
1	0.144	0.122	0.134	-0.078	-0.088	-0.046
2	0.055	0.046	0.064	-0.027	-0.030	-0.027

[DSS = de Florian, Sassot, Stratmann (2007), AKK08 = Albino, Kniehl, Kramer (2008)]

- ▶ PYTHIA consistent with fragmentation functions
- ▶ Large uncertainties because we need $D_q^{h+} - D_q^{h-} = D_q^{h+} - D_{\bar{q}}^{h+}$
Most fragmentation data is e^+e^- giving $D_q^{h+} + D_{\bar{q}}^{h+}$

Introduction
○○○○○

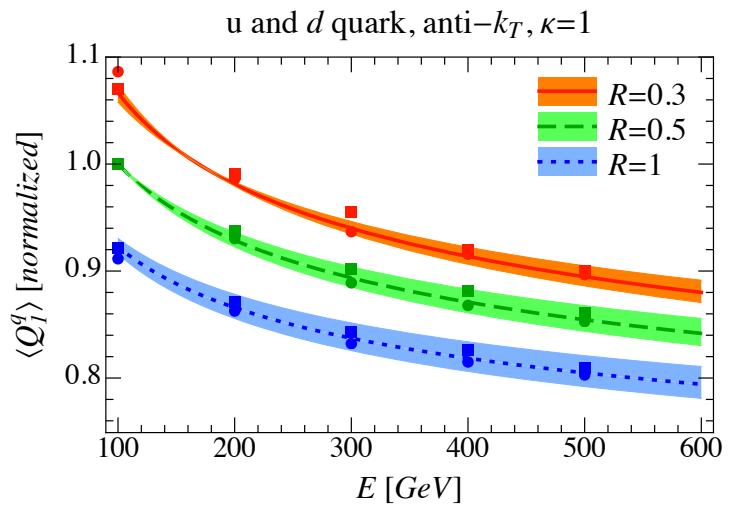

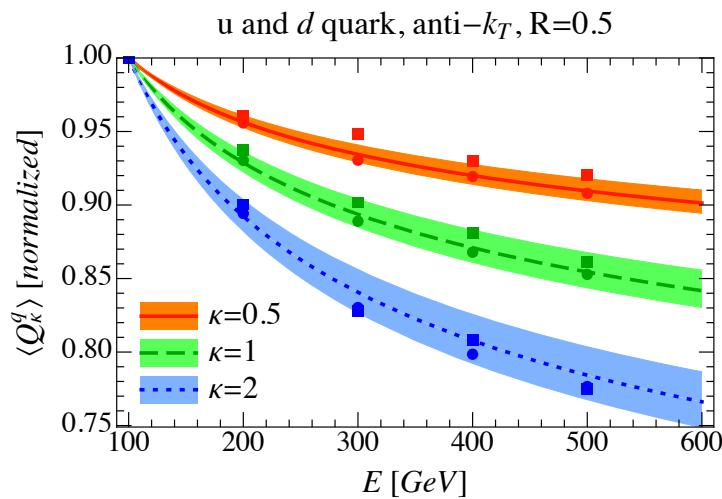

Calculation
○○○○○

Comparison with PYTHIA
○○●○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Average Jet Charge

- ▶ PYTHIA results for d = squares, u = circles
- ▶ Normalizing removes dependence on nonperturbative input and flavor
- ▶ Uncertainty bands from varying μ by factors of 2
- ▶ Good agreement

Introduction
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Width of Quark Jet Charge

- Good agreement for $\kappa \gtrsim 1$

Introduction
○○○○○

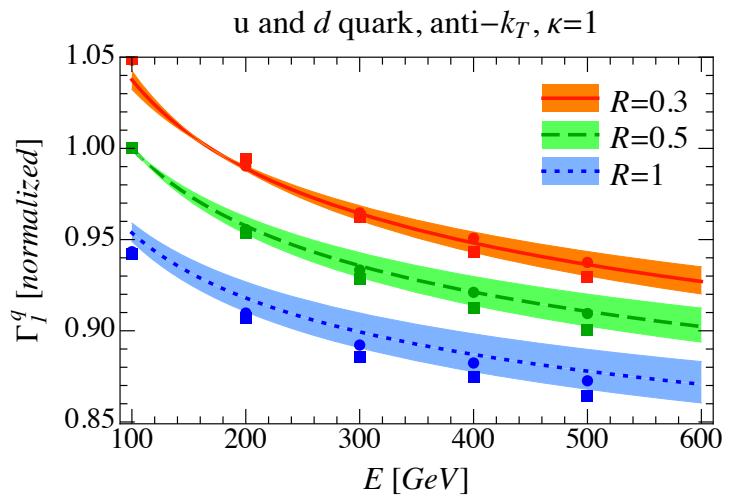

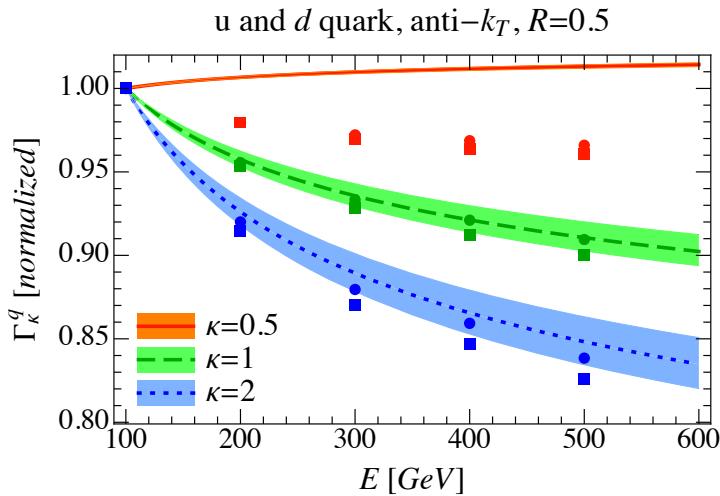

Calculation
○○○○○

Comparison with PYTHIA
○○○●○

Track-Based Observables
○○○○○○○○○○

Conclusions
○

Width of Quark Jet Charge

- Good agreement for $\kappa \gtrsim 1$
- Disagreement for $\kappa = 0.5$:
 - Rise caused by mixing with gluons
 - Large power corrections? (scale like $\sim \lambda^{2\kappa}$, absent for average)
 - Issue with PYTHIA? (rises when hadronization off)

Introduction
○○○○

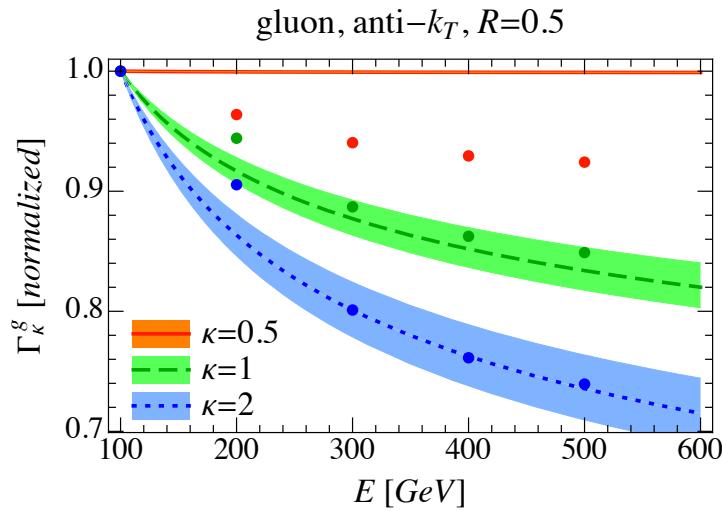

Calculation
○○○○

Comparison with PYTHIA
○○○●

Track-Based Observables
○○○○○○○○

Conclusions
○

Width of Gluon Jet Charge

- ▶ Good agreement for $\kappa \gtrsim 1$
- ▶ Disagreement for $\kappa = 0.5$ (same possible explanations)

Introduction
○○○○

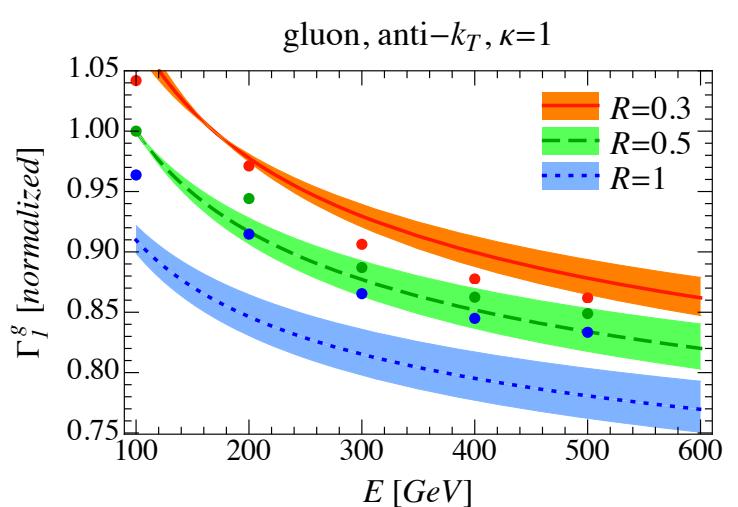

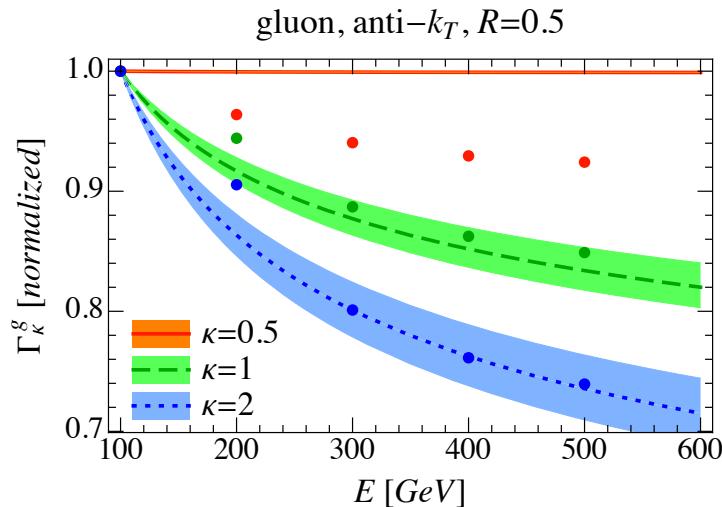

Calculation
○○○○

Comparison with PYTHIA

Conclusions
○

Tracks Rule!

Advantages:

- ▶ Better angular resolution
- ▶ Much better pointing → less sensitive to pile-up

Disadvantages:

- ▶ Smearing of (resonance) peaks
- ▶ Not infrared safe

Introduction
○○○○○

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

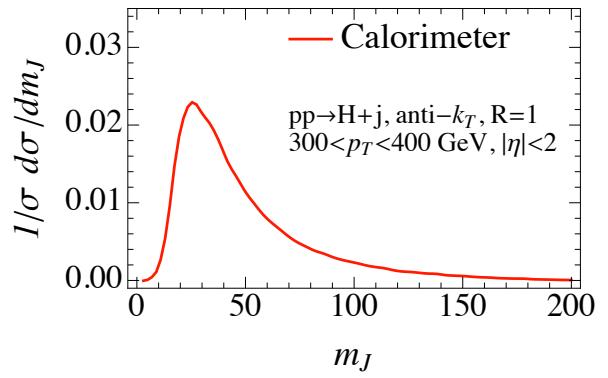

Track-Based Observables
○○●○○○○○○

Conclusions
○

Track-Based Observables

- ▶ IR safe observable e :

$$\frac{d\sigma}{de} = \sum_N \int d\Pi_N \frac{d\sigma_N}{d\Pi_N} \delta[e - \hat{e}(\{p_i^\mu\})]$$

Introduction
○○○○○

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○●○○○○○○

Conclusions
○

Track-Based Observables

- ▶ IR safe observable e :

$$\frac{d\sigma}{de} = \sum_N \int d\Pi_N \frac{d\sigma_N}{d\Pi_N} \delta[e - \hat{e}(\{p_i^\mu\})]$$

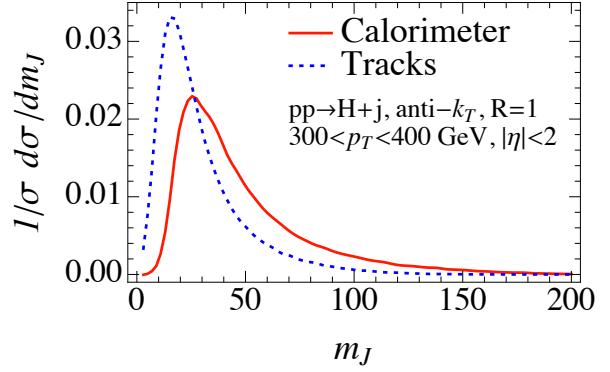

- ▶ Track-based version \bar{e} :

$$\frac{d\sigma}{d\bar{e}} = \sum_N \int d\Pi_N \frac{d\bar{\sigma}_N}{d\Pi_N} \underbrace{\int \prod_{i=1}^N dx_i T_i(x_i) \delta[\bar{e} - \hat{e}(\{\mathbf{x}_i p_i^\mu\})]}_{\text{hadronization}}$$

- ▶ Partons hadronize independently at leading power
- ▶ Momentum of charged particles

$$\bar{p}_i^\mu = \mathbf{x}_i p_i^\mu + \mathcal{O}(\Lambda_{\text{QCD}})$$

- ▶ Distribution in \mathbf{x}_i described by track function $T_i(x_i)$

Introduction
○○○○○

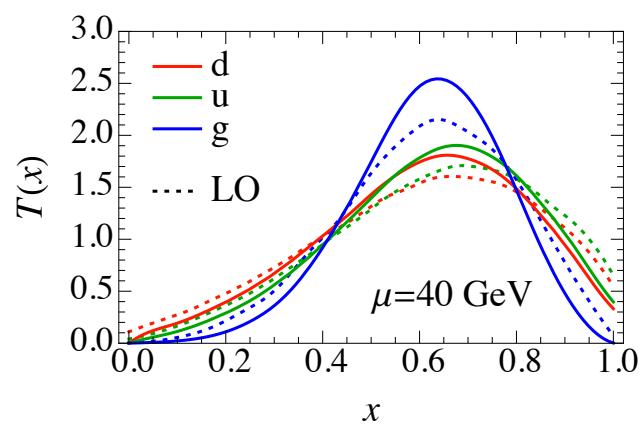

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○●○○○○○

Conclusions
○

Track Function

- ▶ Extracted using $x = \text{track/total jet energy}$ at $\mu = ER$

Introduction
○○○○○

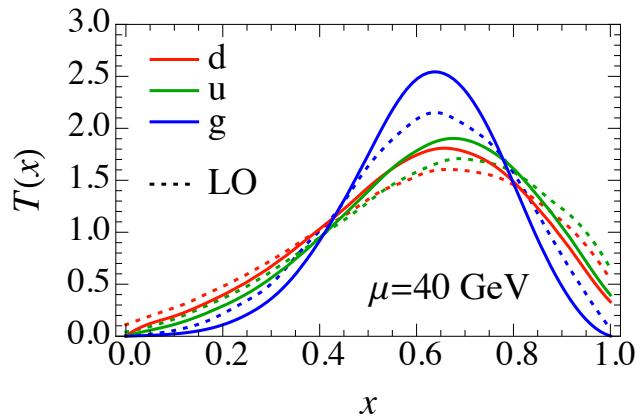

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○●○○○○○

Conclusions
○

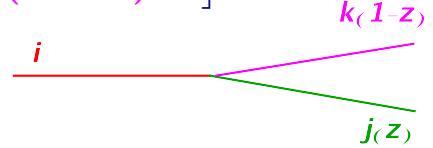

Track Function

- ▶ Extracted using $x = \text{track/total jet energy}$ at $\mu = ER$
- ▶ NLO partonic track function:

$$T_{i,\text{bare}}^{(1)}(x) = \sum_j \int dz \left[\frac{\alpha_s(\mu)}{4\pi} \left(\frac{1}{\epsilon_{\text{UV}}} - \frac{1}{\epsilon_{\text{IR}}} \right) P_{ji}(z) \right] \int dx_1 T_j^{(0)}(x_1, \mu) \\ \times \int dx_2 T_k^{(0)}(x_2, \mu) \delta[x - zx_1 - (1-z)x_2]$$

- ▶ IR divergence cancels in matching
- ▶ UV divergence gives parton shower evolution

Conclusions
○

Track Mass

- ▶ Pythia with hadronization replaced by track functions:
Each emission in shower/resummation hadronizes independently
- ▶ Good agreement (difference is usual nonperturbative shift)
- ▶ Working on resummed track mass calculation

Introduction
○○○○○

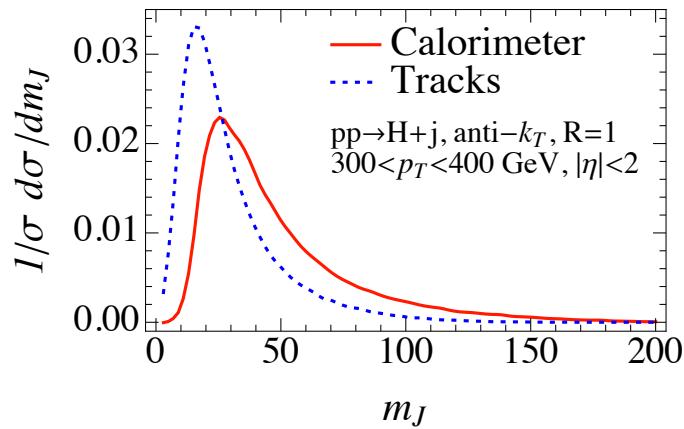

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○●

Conclusions
○

Ratio Observables

- ▶ Smearing from hadronization fluctuations (width of track function)

Introduction
○○○○○

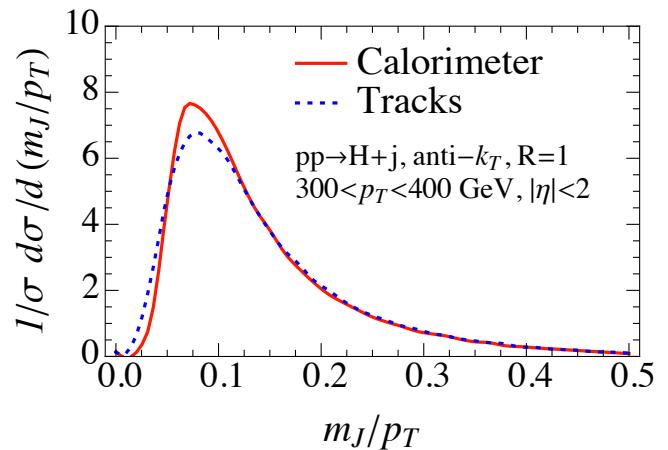

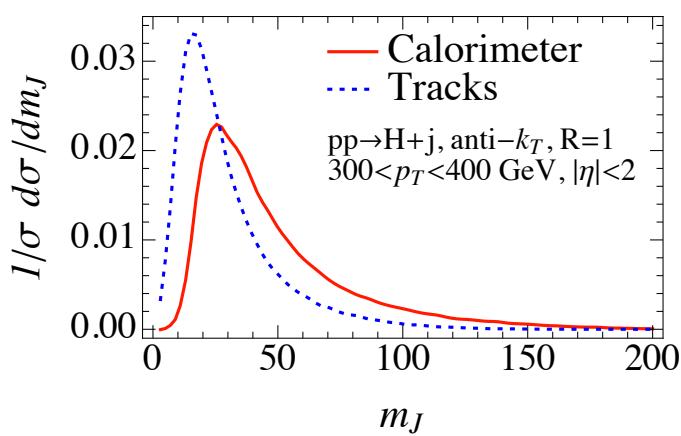

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○●

Conclusions
○

Ratio Observables

- ▶ Smearing from hadronization fluctuations (width of track function)
- ▶ Reduced smearing for ratio observables since fluctuations correlated
- ▶ E.g. ratios of energy correlation functions [Andrew's talk]
 N -subjettiness ratios [Thaler, Tilburg (2010)]

Introduction
○○○○○

Calculation
○○○○○

Comparison with PYTHIA
○○○○○

Track-Based Observables
○○○○○○○○○○

Conclusions
●

Conclusions

- ▶ Jet charge is old tool with new LHC applications
- ▶ Track-based observables less sensitive to pile-up, better angular resolution
- ▶ Partonic calculation not IR safe → hadronization crucial
- ▶ Calculational framework:
 - ▶ Match on track function (charge distr.) with parton-shower evolution
 - ▶ Agrees with PYTHIA (except $\kappa = 0.5$)
 - ▶ Systematically improvable
