Road map after the discovery

# ATLAS results

$$M_H = 126.0 \pm 0.4 \text{ (stat)} \pm 0.4 \text{ (sys)}$$

5.9  $\sigma$  significance !

# CMS results

$$M_H = 125.3 \pm 0.4 \text{ (stat.)} \pm 0.5 \text{ (syst.) GeV}$$

5.0  $\sigma$  significance !

**Both CMS and ATLAS have excluded SM Higgs  
 in the mass interval upto about 560 GeV  
 except small interval where the signal was observed**

# Summer 2012 Tevatron Combination

Tevatron Run II Preliminary,  $L \leq 10.0 \text{ fb}^{-1}$

# Higgs production modes, decays and signatures at LHC

Gluon-gluon fusion

W/Z-Higgs associated

Vector boson fusion

t t-bar Higgs associated

Not only discovery and mass measurement

but also

Very good precision of the mass measurement

Exclusion of large range of higher masses

$$V(\Phi) = \mu^2 \Phi^\dagger \Phi + \lambda (\Phi^\dagger \Phi)^2$$

$$\Phi \rightarrow \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ H+v \end{pmatrix}$$

$$\mathcal{L}_H = \frac{1}{2} (\partial_\mu H) (\partial^\mu H) - V = \frac{1}{2} (\partial^\mu H)^2 - \lambda v^2 H^2 - \lambda v H^3 - \frac{\lambda}{4} H^4$$

$$M_H^2 = 2\lambda v^2 = -2\mu^2$$

$$\lambda \cong 0.12$$

Origin of the EWSB potential  $\rightarrow$  a weakly-coupled theory

# July

# November

# 1. How much the observed state corresponds to the SM Higgs ?

Bezrukov, Shaposhnikov;

Degarssi et al;

Espinosa, Grojean, Meuhlleitner, Trott;

Park, Rinkevicius, Snowballa;

Carena, Low, Wagner;

Azatov et al

....

# 2. What are differences in production and decay for the resonant states with different $J^{PC}$ ? How to extract and measure quantum numbers of the new state?

Ellis, Hwang, Sanz, You;

Ellis, Hwan;

Bolognes et al;

Choi, Meuhlleitner, Zerwas

....

# 3. How much the observed state correspond to possible Higgses in various BSM scenarios ? What are implications to various BSM?

Nath; Peskin; Kuflik et al, Abe et al; Athron et al; Bae et al; Basso et al; Brehmer et al;

Ohlsson et al; Belanger et al....

Discovering of new Higgs-like state

Not discovering anything else

"Theorist"

"Experimentalist"

# How to measure properties?

Bolognes et al 2012

$X \rightarrow ZZ^* \rightarrow 4l$

$X \rightarrow WW^* \rightarrow l\nu l\nu$

$X \rightarrow \gamma\gamma$

$X : 0^+, 0^-, 2^+_m, 2^+_h$

Many differences in various kinematic variables

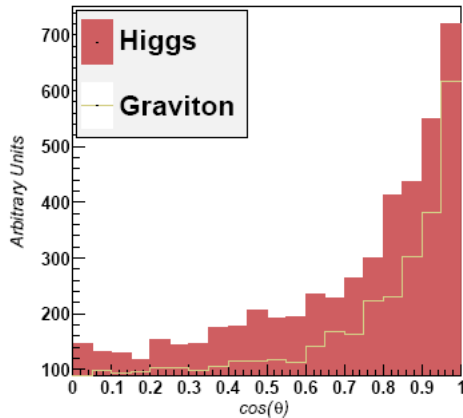

With more realistic simulations:

Ellis et al 2012

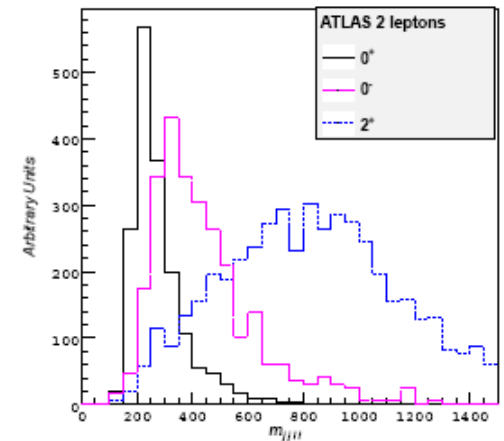

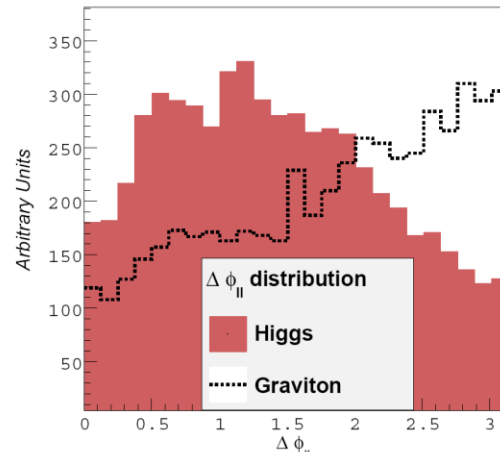

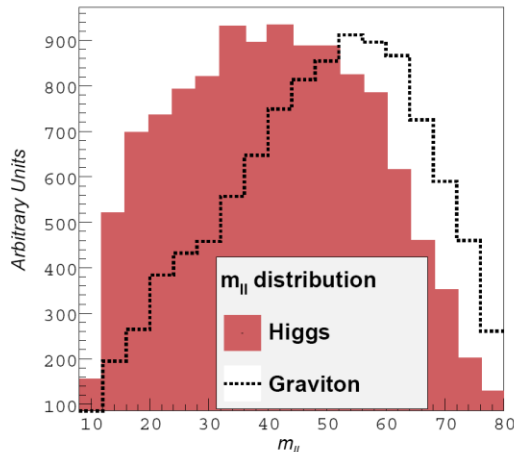

$$pp \rightarrow X_{0,2} \rightarrow \gamma\gamma \quad \frac{d\sigma}{d\Omega} \sim \frac{1}{4} + \frac{3}{2} \cos^2 \theta^* + \frac{1}{4} \cos^4 \theta^*$$

$$M_X = 125 \text{ GeV}$$

$$pp \rightarrow Z + X_{0+,0-,2+}$$

$$pp \rightarrow X_{0,2} \rightarrow WW^* \rightarrow l\nu l\nu$$

An answer from experiments one might expect soon

May be the SM is the consistent quantum theory till very large scales:

No Landau pole (triviality)

Positive self coupling  $\lambda(Q^2) > 0$   
(vacuum stability)

125 GeV

Bezrukov, Shaposhnikov 2012  
Degarssi et al 2012

However, the simplest Higgs mechanism SM is not stable with respect to quantum corrections (little hierarchy problem)

Loop corrections to the Higgs mass

$$\delta m_H^2 = \frac{3G_F}{4\sqrt{2}\pi^2} (2m_W^2 + m_Z^2 + m_H^2 - 4m_t^2) \Lambda^2 \approx -(0.2 \Lambda)^2$$

$$\delta m_H < m_H$$

$$\Lambda < 1 \text{ TeV}$$

In SM there is no symmetry which protects a strong dependence of Higgs mass on a possible new scale

Something is needed in addition to SM...

There is a number of facts which needs to be explained

1. EW symmetry is broken – photon is massless, W and Z are massive prticles  
Fermions have very much different masses  
( $M_{\text{top}} \approx 172 \text{ GeV}$ ,  $m_e \approx 0.5 \text{ MeV}$ ,  $\Delta M_{\nu} \approx 10^{-3} \text{ eV}$ )

2. Dark Matter exists in the Universe

Rotation curves of galaxies

Large Scale Structure

CMB

Lensing

3.  $(g-2)_\mu$  (about  $3.5 \sigma$ ) 4. Neutrino oscillations

4. Particle - antiparticle asymmetry in the Universe,  
CP violation

baryon asymmetry:  $\frac{n_B - n_{\bar{B}}}{n_B + n_{\bar{B}}} \sim 10^{-10}$

5. Gravity (no connection to EW?). Why gravity is so weak?

$$\mathcal{L} = \mathcal{L}_h - (M_W^2 W_\mu^+ W^{\mu-} + \frac{1}{2} M_Z^2 Z_\mu Z^\mu) [1 + 2a \frac{h}{v} + \mathcal{O}(h^2)] \\ - m_{\psi_i} \bar{\psi}_i \psi_i [1 + c \frac{h}{v} + \mathcal{O}(h^2)] + \dots$$

Contino et al 2012,  
....

Espinosa et al 2012

$$\Gamma(H \rightarrow f\bar{f}) = c^2 \Gamma^{SM}(H \rightarrow f\bar{f}),$$

$$\Gamma(H \rightarrow VV) = a^2 \Gamma^{SM}(H \rightarrow VV),$$

$$\Gamma(H \rightarrow gg) = c^2 \Gamma^{SM}(H \rightarrow gg),$$

$$\Gamma(H \rightarrow \gamma\gamma) = \frac{(cI_\gamma + aJ_\gamma)^2}{(I_\gamma + J_\gamma)^2} \Gamma^{SM}(H \rightarrow \gamma\gamma)$$

**In SM  $a=1$  and  $c=1$**

# One of the motivation - Effective chiral Lagrangian from holographic viewpoint

$$\mathcal{L} = \frac{1}{2}(\partial_\mu h)^2 + \frac{v^2}{4}\text{Tr}(D_\mu \Sigma^\dagger D^\mu \Sigma) \left[ 1 + 2a \frac{h}{v} \right] \\ - \frac{v}{\sqrt{2}} (\bar{u}_L^i \bar{d}_L^i) \Sigma \left[ 1 + c \frac{h}{v} \right] \begin{pmatrix} y_{ij}^u u_R^j \\ y_{ij}^d d_R^j \end{pmatrix} + h.c. + \dots$$

Crojean et al 2012

$$\mathcal{L} = \frac{1}{2}(\partial_\mu h)^2 - \frac{1}{2}m_h^2 h^2 - \frac{d_3}{6} \left( \frac{3m_h^2}{v} \right) h^3 - \frac{d_4}{24} \left( \frac{3m_h^2}{v^2} \right) h^4 \dots \\ - \left( m_W^2 W_\mu W_\mu + \frac{1}{2} m_Z^2 Z_\mu Z_\mu \right) \left( 1 + 2a \frac{h}{v} + b \frac{h^2}{v^2} + \dots \right) \\ - \sum_{\psi=u,d,l} m_{\psi^{(i)}} \bar{\psi}^{(i)} \psi^{(i)} \left( 1 + c_\psi \frac{h}{v} + c_{2\psi} \frac{h^2}{v^2} + \dots \right) \\ + \frac{g^2}{16\pi^2} \left( c_{WW} W_{\mu\nu}^+ W_{\mu\nu}^- + c_{ZZ} Z_{\mu\nu}^2 + c_{Z\gamma} Z_{\mu\nu} \gamma_{\mu\nu} \right) \frac{h}{v} + \dots \\ + \frac{g^2}{16\pi^2} \left[ \gamma_{\mu\nu}^2 \left( c_{\gamma\gamma} \frac{h}{v} + \dots \right) + G_{\mu\nu}^2 \left( c_{gg} \frac{h}{v} + c_{2gg} \frac{h^2}{v^2} \dots \right) \right] \\ + \frac{g^2}{16\pi^2} \left[ \frac{c_{hhgg}}{\Lambda^2} G_{\mu\nu}^2 \frac{(\partial_\rho h)^2}{v^2} + \frac{c'_{hhgg}}{\Lambda^2} G_{\mu\rho} G_{\rho\nu} \frac{\partial_\mu h \partial_\nu h}{v^2} + \dots \right] \\ + \dots$$

Higgs signal strength parameter:

$$\mu_i = \frac{[\sigma_{j \rightarrow h} \times \text{Br}(h \rightarrow i)]_{\text{observed}}}{[\sigma_{j \rightarrow h} \times \text{Br}(h \rightarrow i)]_{SM}}$$

Global  $\chi^2$  fit

DO, CDF, CMS, ATLAS data

7&8 TeV LHC data & Tevatron + EWP

Giardino et al 2012

$L=4.6-5.1(7 \text{ TeV})+5.1-5.9(8 \text{ TeV}) \text{ fb}^{-1}$ , 68% CL: ATLAS + CMS

## Expected uncertainties in CMS

Coupling	Uncertainty (%)			
	300 fb <sup>-1</sup>		3000 fb <sup>-1</sup>	
	Scenario 1	Scenario 2	Scenario 1	Scenario 2
$\kappa_\gamma$	6.5	5.1	5.4	1.5
$\kappa_V$	5.7	2.7	4.5	1.0
$\kappa_g$	11	5.7	7.5	2.7
$\kappa_b$	15	6.9	11	2.7
$\kappa_t$	14	8.7	8.0	3.9
$\kappa_\tau$	8.5	5.1	5.4	2.0

## ATLAS

$\sqrt{s} = 14 \text{ TeV}$ :  $\int L dt = 300 \text{ fb}^{-1}$ ;  $\int L dt = 3000 \text{ fb}^{-1}$

$\int L dt = 300 \text{ fb}^{-1}$  extrapolated from 7+8 TeV

## Main options beyond SM

1. Fundamental Higgs:
  - Supersymmetric models  
(MSSM, NMSSM...)
2. Composite Higgs:
  - Models with new strong dynamics  
(Chiral Lagrangians from holography, latest technicolor variants, Little Higgs... )
3. Mixed cases:
  - Models with extra space dimensions
  - Partially composite models...

Pomarol 2012

# SUSY

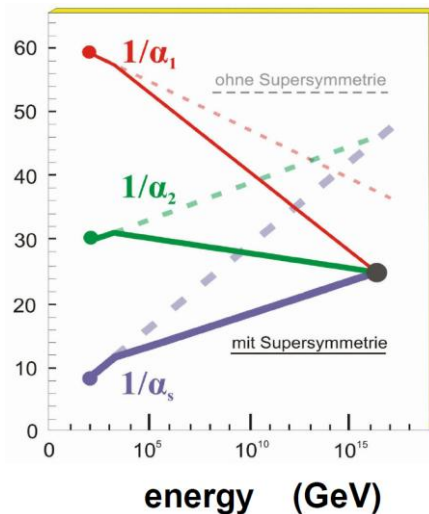

## 1. Cancellation of $\Lambda^2$ dependence

$$\Delta M_H^2|_{\text{tot}} = \frac{\lambda_f^2 N_f}{4\pi^2} \left[ (m_f^2 - m_S^2) \log\left(\frac{\Lambda}{m_S}\right) + 3m_f^2 \log\left(\frac{m_S}{m_f}\right) \right] \quad M_H \text{ is protected!}$$

## 2. Lightest SUSY particle is stable (if R-parity) – very good Dark Matter candidate

## 3. Unification of couplings in contrast to SM

## 4. Fit of EW precision data

# SUSY is one of the most attractive idea for BSM physics

SUSY, if exists, is broken, and there are many possibilities:

Gravity mediation

Gauge madiation

Gaugino mediation

Anomaly mediation

Hidden sector mediation

...

Many models:

MSSM

CMSSM

mSUGRA

mGMSB

mAMSB

Split SUSY

...

NMSSM

Natural SUSY

...

In general the unconstrained MSSM has 105 parameters  
(22 with reasonable assumptions)

(many parameter space points of mSUGRA scenario are rulled out already)

Concrete predictions depend strongly on MSSM breaking scenario.  
There are no theory arguments to prefer some of them.

Many nice SUSY feaches are due to additional global symmetry-  
R-parity. Tiny deviations of R-parity possible leading to processes  
with FCNC, lepton/barion number violation, proton decay...  
But what is an origin of R-parity?...

$$M_h^2 \leq M_Z^2 + \Delta m^2$$

→ susy breaking term  
(at one-loop)

$$(125 \text{ GeV})^2$$

$$(91 \text{ GeV})^2$$

$$(86 \text{ GeV})^2$$

$$\Delta m_h^2 = \frac{3m_t^4}{4\pi^2 v^2} \left[ \ln \left( \frac{M_{\text{SUSY}}^2}{m_t^2} \right) + \frac{X_t^2}{M_{\text{SUSY}}^2} \left( 1 - \frac{X_t^2}{12M_{\text{SUSY}}^2} \right) \right]$$

$$M_{\text{SUSY}} \equiv \sqrt{m_{\tilde{t}_1} m_{\tilde{t}_2}}$$

**Heavy stop is needed**

**Fine tuning:**

$$-\frac{m_Z^2}{2} = |\mu|^2 + m_{H_u}^2$$

MSSM Higgs Mass

Mahmoudi et al 2012

# Many options for observed state in the NMSSM

Lightest Higgs  $M_h$  125 GeV (most of studies)

Heavy Higgs  $M_h$  98 GeV,  $M_H$  125 GeV (Drees 2012, Belanger et al 2012)

Denenerate Higgses (Gunion et al 2012)

The aim is to make better overall  $\chi^2$  fit...

(Kowalska et al 2012)

A Higgs Impostor in Low-Scale Technicolor is a technipion

$$\eta_T \quad I^G J^{PC} = 0^+ 0^{-+}$$

$\eta_T$  mixes with 0 component of the isovector  $\pi_T^0$  giving  
two physics states

$\eta_L$  at 125 GeV and  $\eta_H$  in the range 170-190 GeV

$\gamma\gamma$ -rate is OK, but  $ZZ^*$  and  $WW^*$  should be suppressed

Eichten, Lane, Martin 2012

Natural scale  $\Lambda \sim 4\pi v$  with  $v=246$  GeV

But the mass of the technicolor isosinglet scalar  
(the technicolor Higgs) could be much reduced dynamically for large  $N_{TC}$ :

$$(M_H^0)^2 = \left[ \frac{N_{TC}}{3} \right]^p \frac{3}{N_{TC}} \frac{1}{N_{TD}} \frac{v^2}{f_\pi^2} m_\sigma^2$$

Foadi, Frandsen, Sannino 2012

# 4<sup>th</sup> generation

Eberhardt, Herbert, Lacker 2012

In the SM4 the measured  $H \rightarrow \gamma\gamma$  signal strength disagrees with the best-fit prediction including all EWPD by more than four standard deviations

# Is the 125 GeV Higgs the superpartner of a neutrino?

Riva, Biggio, Pomarol 19/11/12

Approximate R-symmetry acts as a lepton number

New signatures similar to leptoquark searches

# Conclusions

1. New Higgs-like state is found with very precise mass determination  
 $M_H = 126.0 \pm 0.4 \text{ (stat)} \pm 0.4 \text{ (sys)}$  ATLAS  
 $M_H = 125.3 \pm 0.4 \text{ (stat)} \pm 0.5 \text{ (sys)}$  CMS
2. The self-coupling is small ( $\lambda \cong 0.12$ )  $\rightarrow$  weakly-coupled theory
3. Higgs-like states with the SM signal strength (even about 2 times larger) are excluded up to  $\sim 600 \text{ GeV}$
4. Measurements in all channels are compatible with the SM expectations computed for the SM Higgs couplings.  
However, bb-mode is only observed at the Tevatron,  $\tau\tau$ -mode is not observed  
$$\hat{\mu} \equiv \frac{\sigma(pp \rightarrow h)_{obs}}{\sigma(pp \rightarrow h)_{SM}} = 1.4 \pm 0.3 \text{ (ATLAS)}, 0.87 \pm 0.23 \text{ (CMS)},$$
$$R_{\gamma\gamma} \equiv \hat{\mu} \frac{\Gamma(h \rightarrow \gamma\gamma)_{obs}}{\Gamma(h \rightarrow \gamma\gamma)_{SM}} = 1.8 \pm 0.5 \text{ (ATLAS)}, 1.6 \pm 0.4 \text{ (CMS)}$$
6. Non of the BSM extensions are excluded completely, however possible parameter spaces for various SUSY, composite, extra dimensional scenarios are much constrained. Enormous number of interpretations is proposed.
7. Further more precise measurements of production/decay properties and quantum numbers, searches for other Higgs (not SM like) states, and theoretical studies are needed

Many thanks  
to the organizers!
