

Searches Beyond the Standard Model at ATLAS

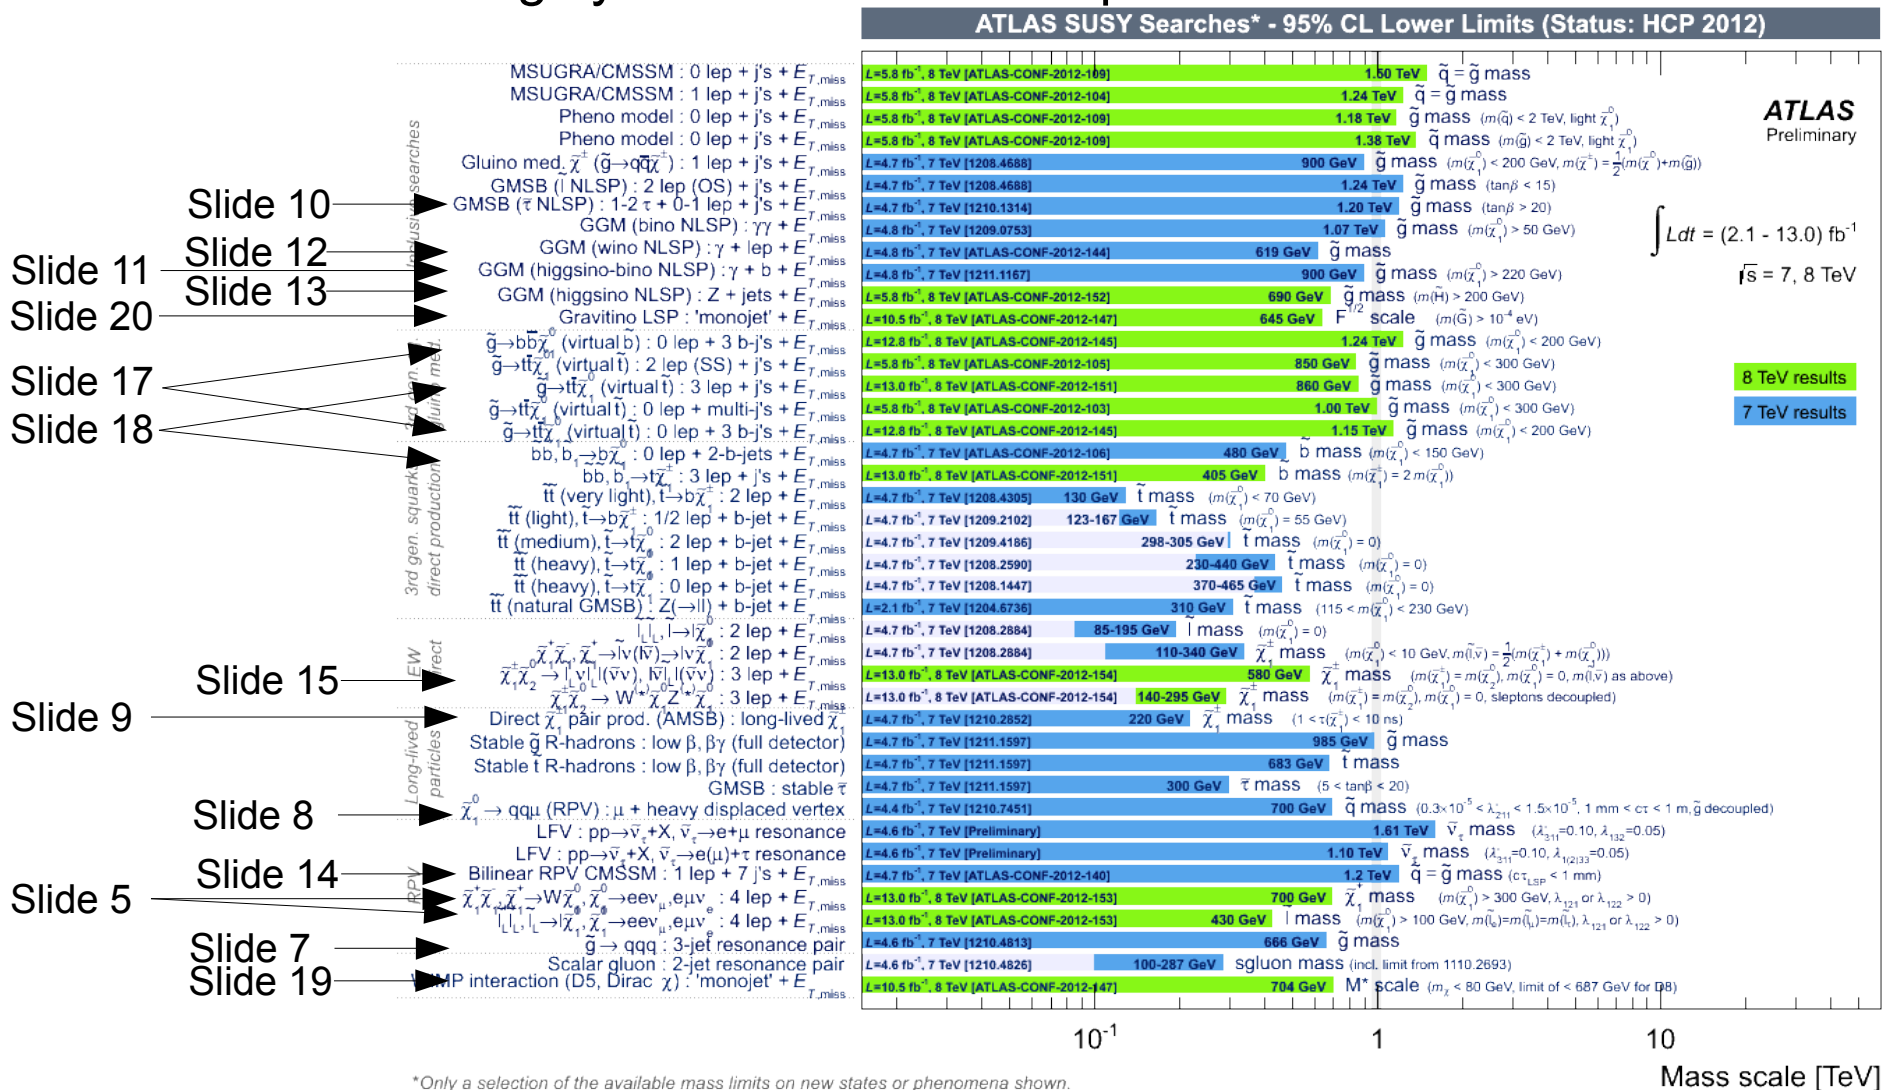

LHC on the March
November 20-22, 2012

Nathan Triplett – On behalf of the ATLAS collaboration

Outline

- ATLAS Exotics and SUSY searches have been extensive
- Most new models tested with limits at or above 1 TeV
- This talk will focus largely on results from the past two months

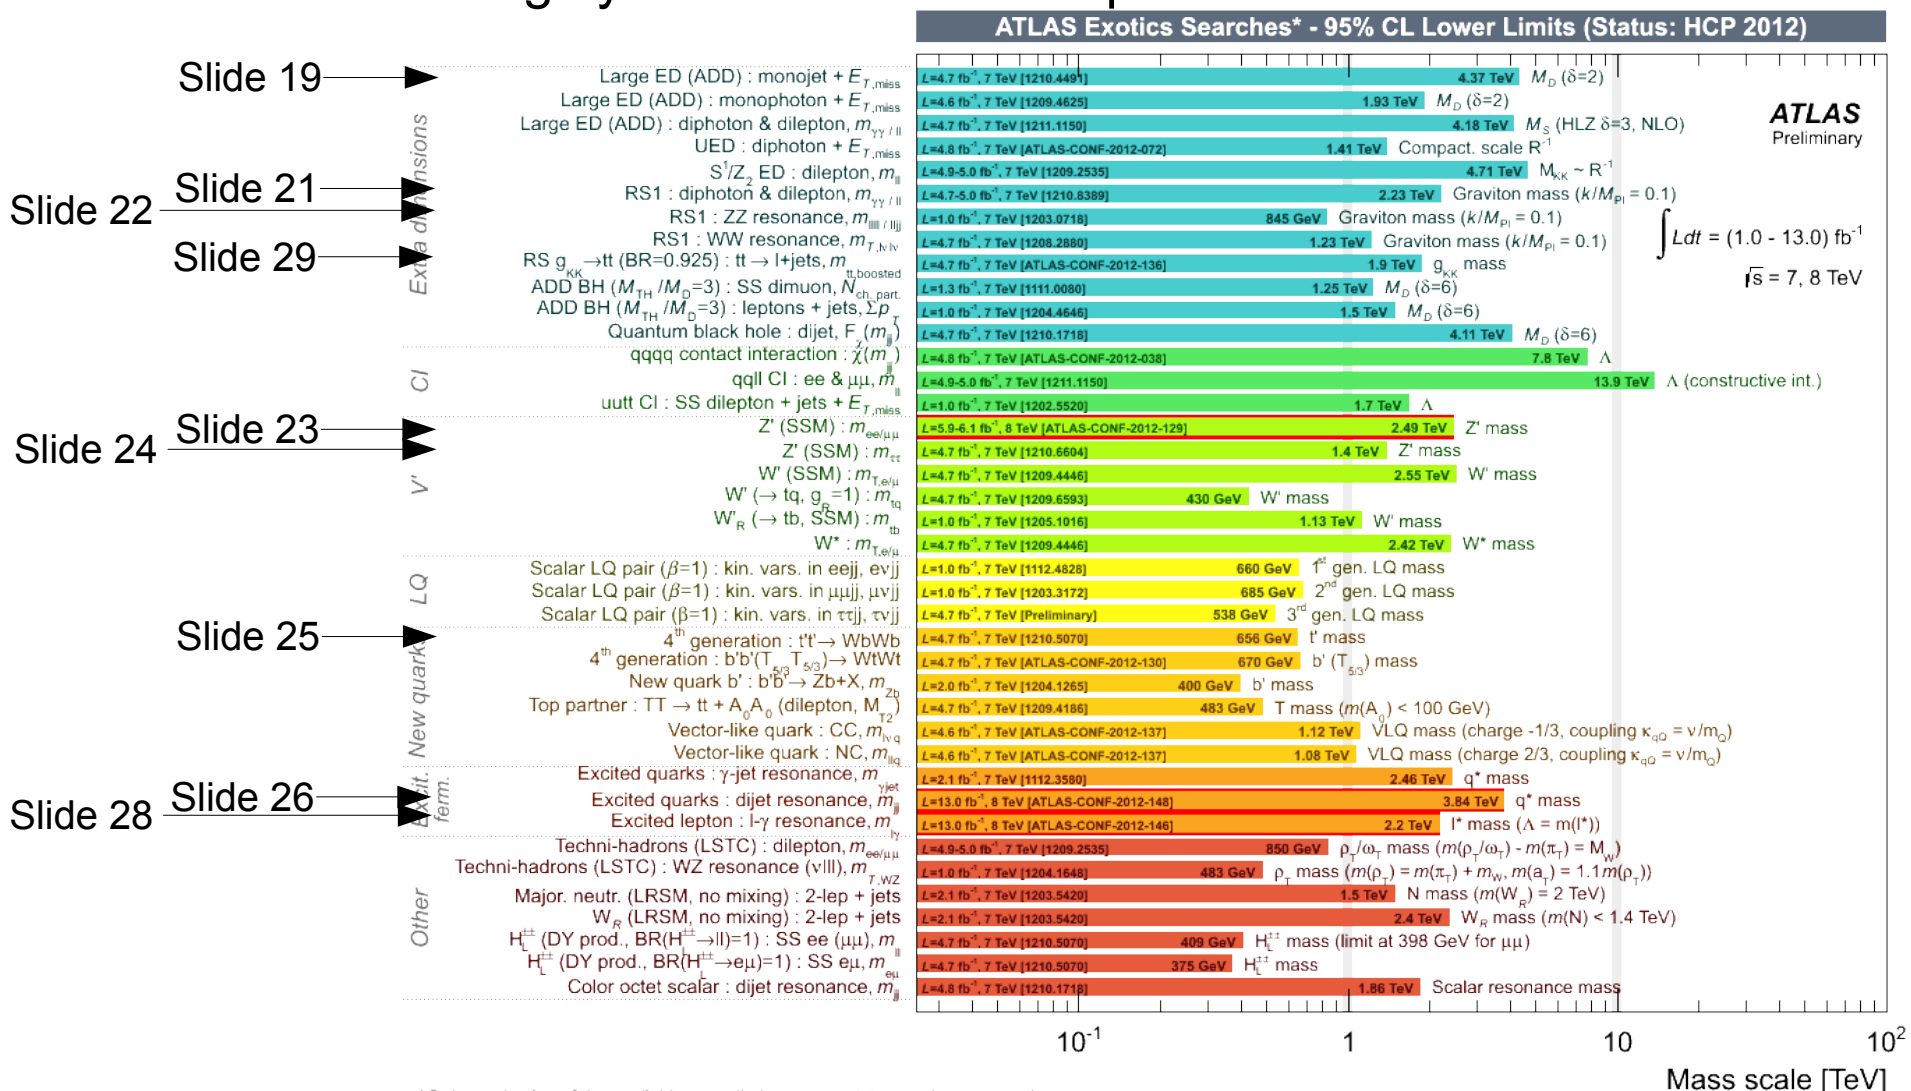

*Only a selection of the available mass limits on new states or phenomena shown.

All limits quoted are observed minus 1 σ theoretical signal cross section uncertainty

Outline

- ATLAS Exotics and SUSY searches have been quite extensive
- Most new models tested with limits at or above 1 TeV
- This talk will focus largely on results from the past two months

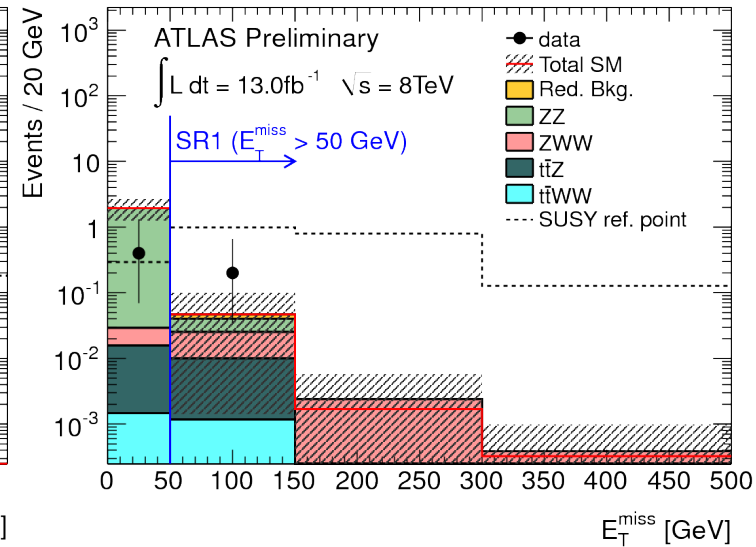

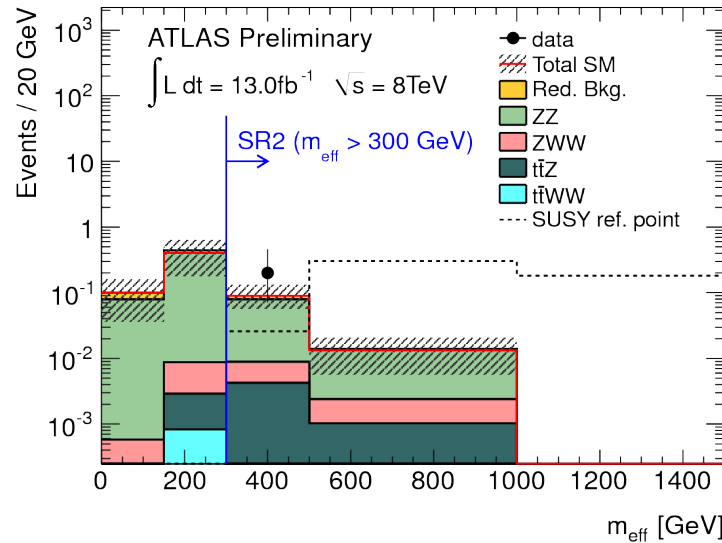

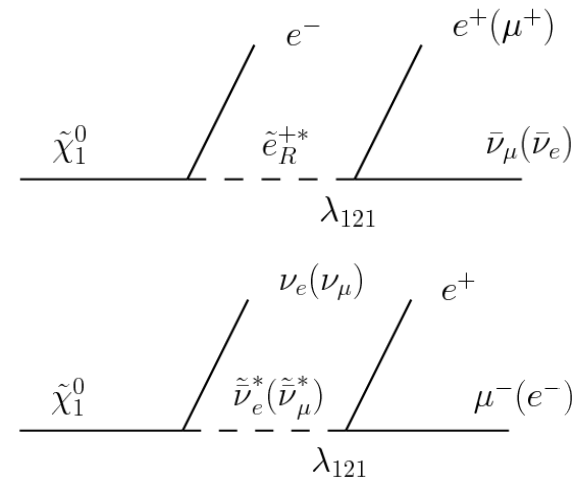

Some BSM models in this talk

- R-parity violating (RPV) SUSY
 - $P_R = (-1)^{2S+3B+L}$
 - Lightest SUSY particle is stable if P_R is conserved
- Anomaly-mediated SUSY breaking (AMSB)
 - Soft SUSY breaking via loop effects
 - Can cause nearly degenerate particle masses
- Gauge-mediated SUSY breaking (GMSB)
 - Gravitino is the LSP
 - Look for decays of NLSP \rightarrow Gravitino
- General Gauge Mediation (GGM)
 - Generalizes GMSB
 - Allows squarks/gluinos below 1 TeV
- Large Extra Dimensions
 - Look for graviton decays into photons
- New “SM like” particles
 - 4th Generation quarks
 - New Z-like boson
- Compositeness
 - Look for substructure inside quarks and leptons

RPV SUSY: 4 lepton channel (1)

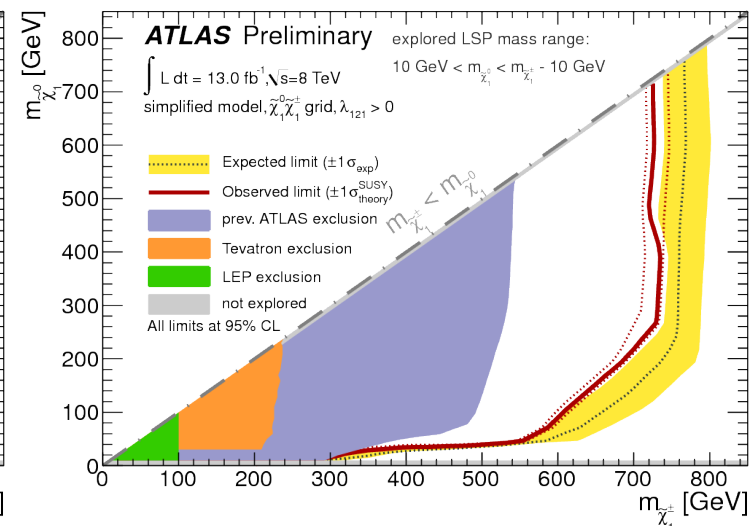

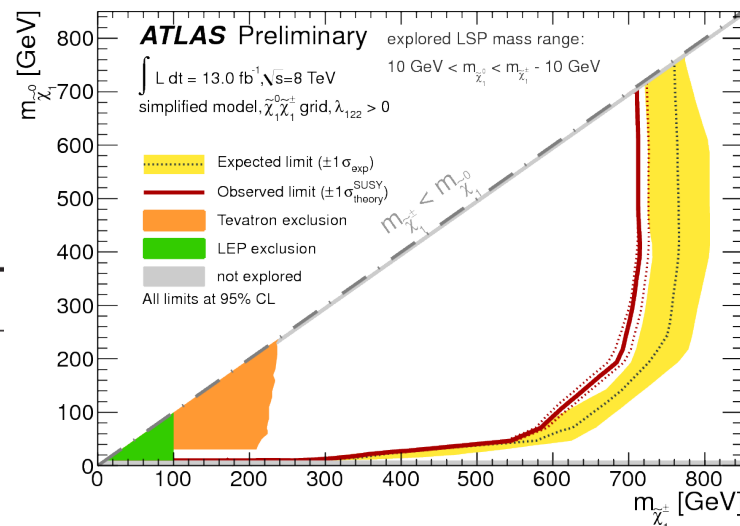

- 8 TeV analysis
- Pair produced LSP \rightarrow 4 leptons + neutrinos

RPV Wino simplified model

- Choice of NLSP affects limits
- 4 models tested
- Selection:
 - 4 electrons/muons
 - Large MET or Meff
- 2 signal regions

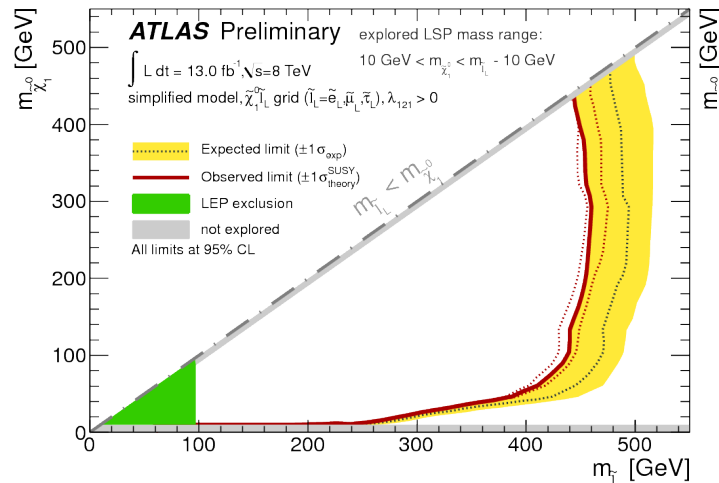

| Selection | SR1 | SR2 |
|--------------------------------|----------|----------|
| Number of leptons | ≥ 4 | ≥ 4 |
| SFOS pair | — | — |
| Z-candidate | Z-veto | Z-veto |
| $E_T^{\text{miss}}/\text{GeV}$ | > 50 | — |
| $m_{\text{eff}}/\text{GeV}$ | — | > 300 |

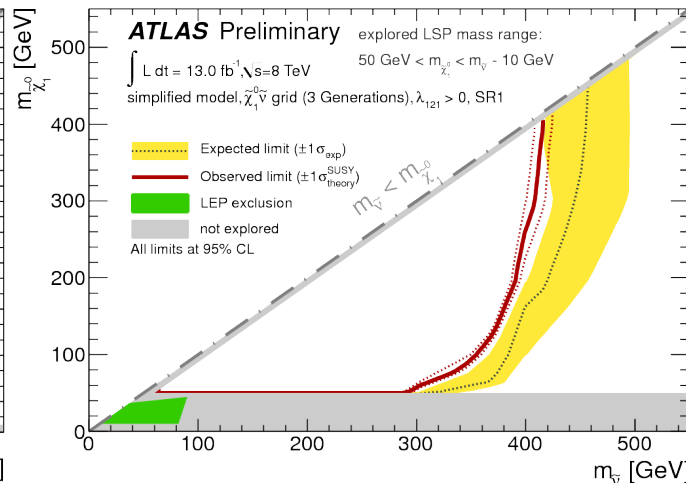

RPV SUSY: 4 lepton channel (2)

Each set of limits assumes a different NLSP as listed below

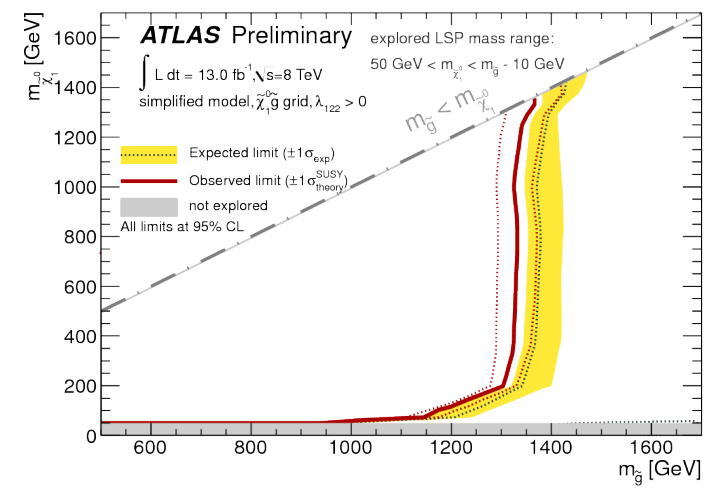

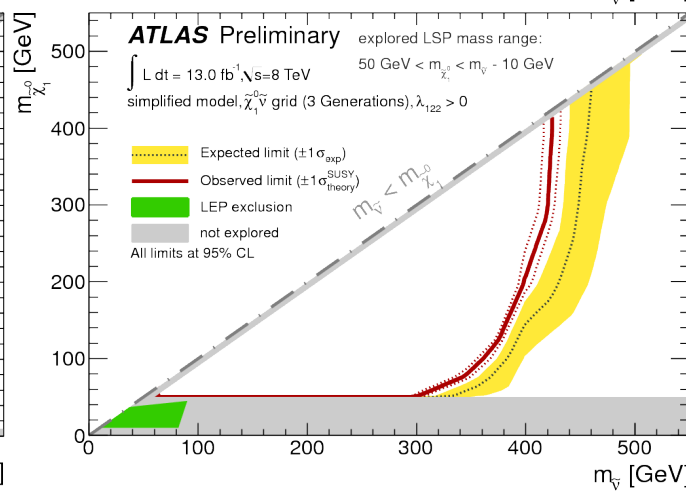

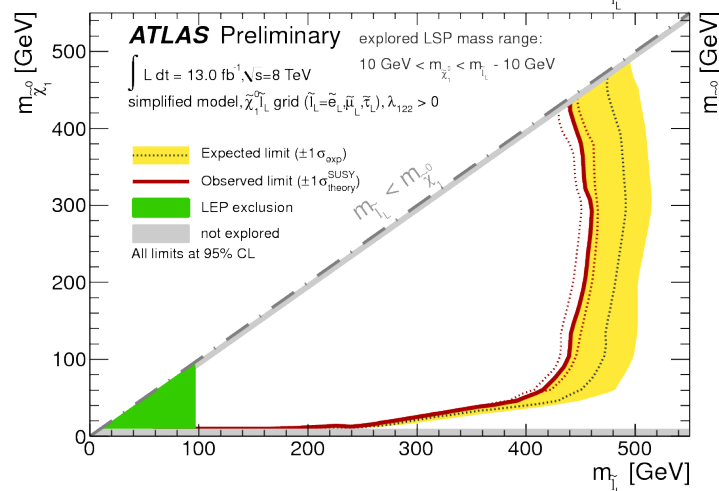

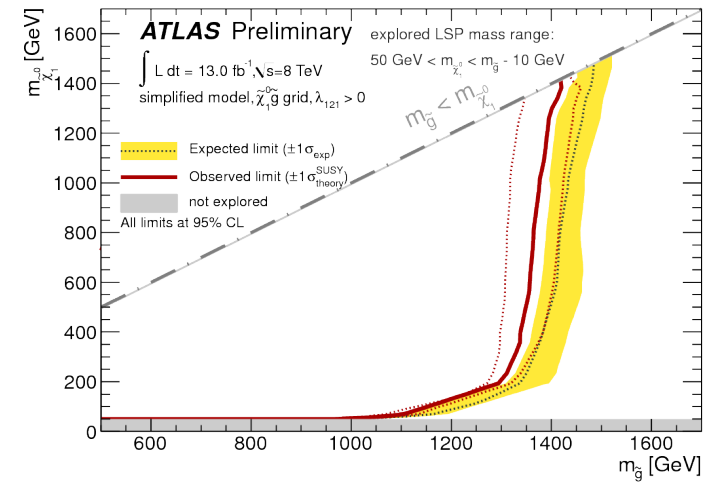

RPV L-slepton
Simplified models

RPV sneutrino
Simplified models

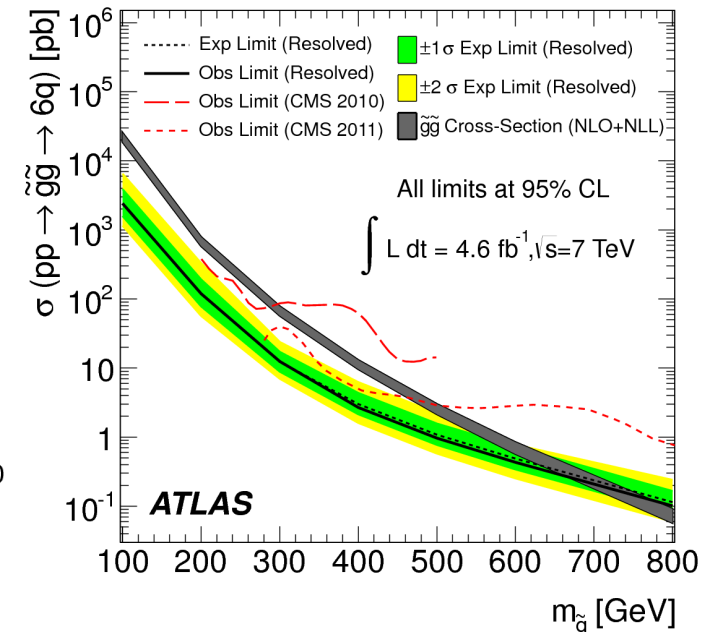

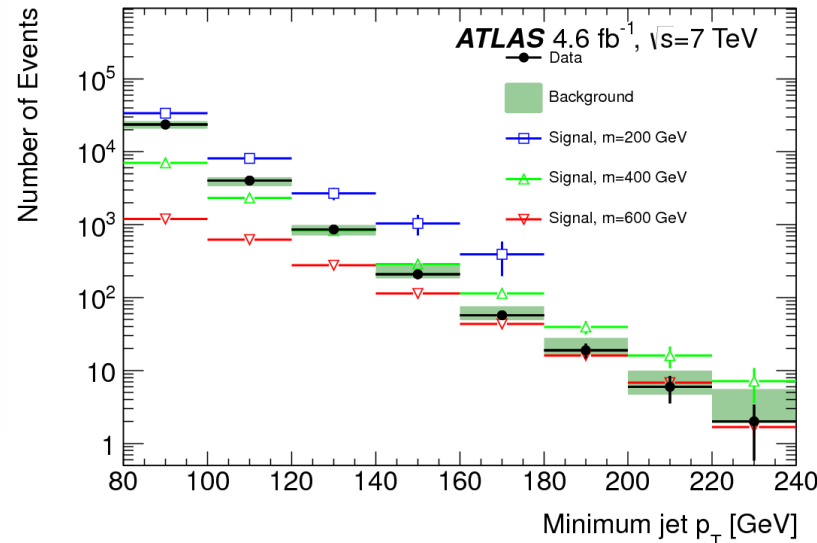

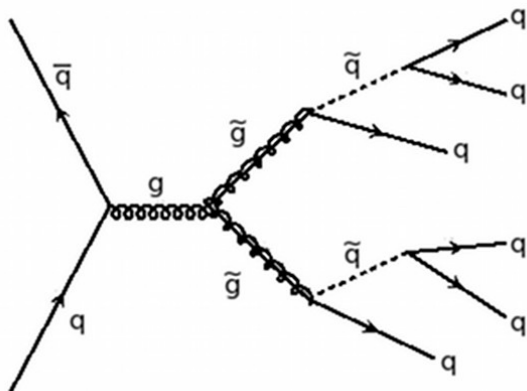

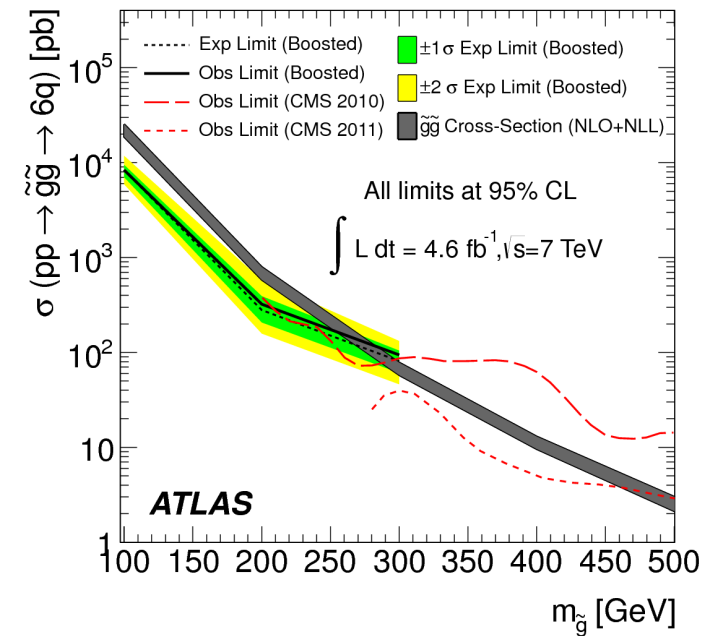

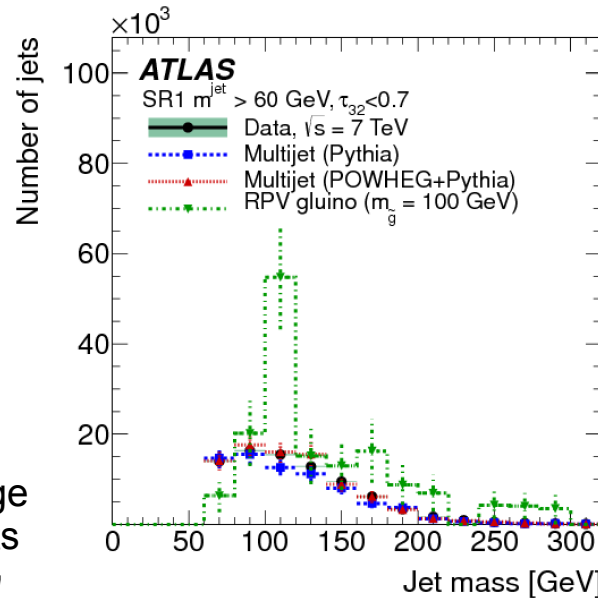

RPV gluino
Simplified models

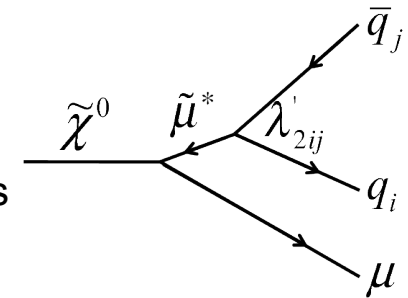

RPV SUSY: gluino \rightarrow 3 quarks

- Pair produced gluinos
 - Each decays to three quarks
- 2 analysis methods
 - Resolved analysis
 - Look for events with 6 high p_T jets
 - p_T of 6th jet is main kinematic discriminant
 - Boosted analysis
 - Look for events with two heavy, large radius jets and 4 normal ($R=0.4$) jets
 - Main discriminant are the large jets' substructure, mass, p_T

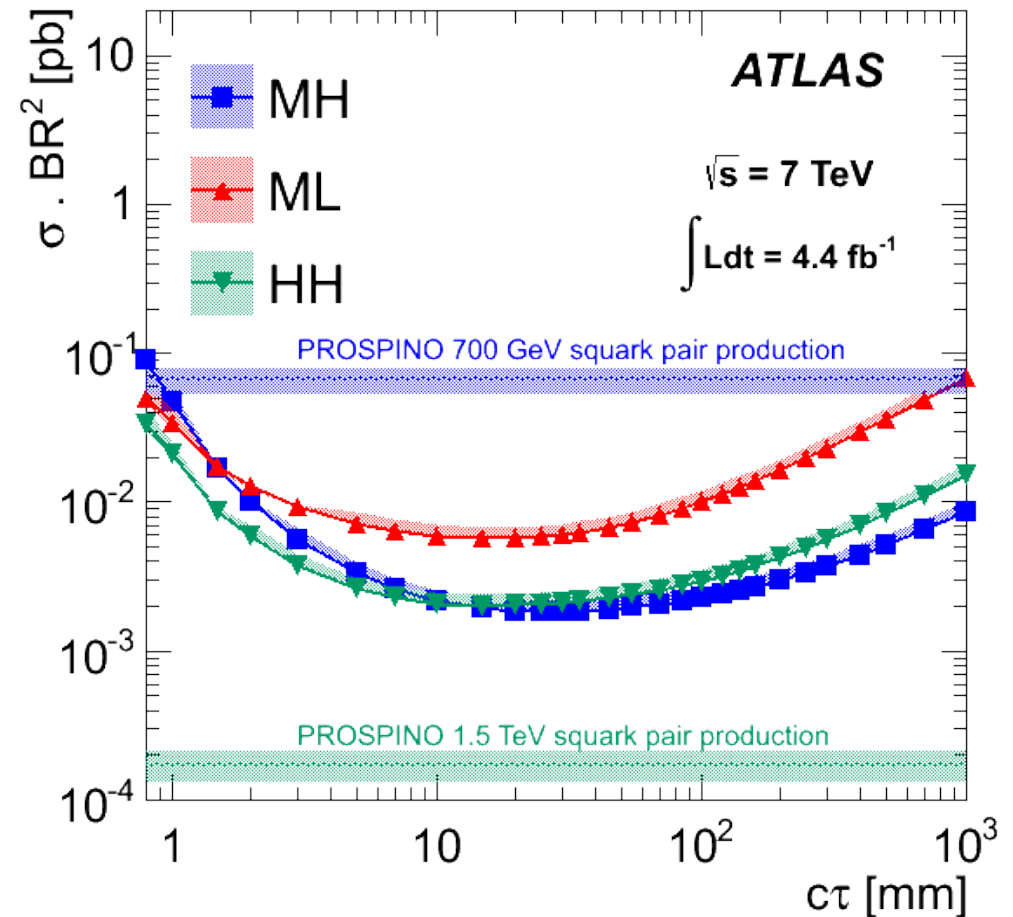

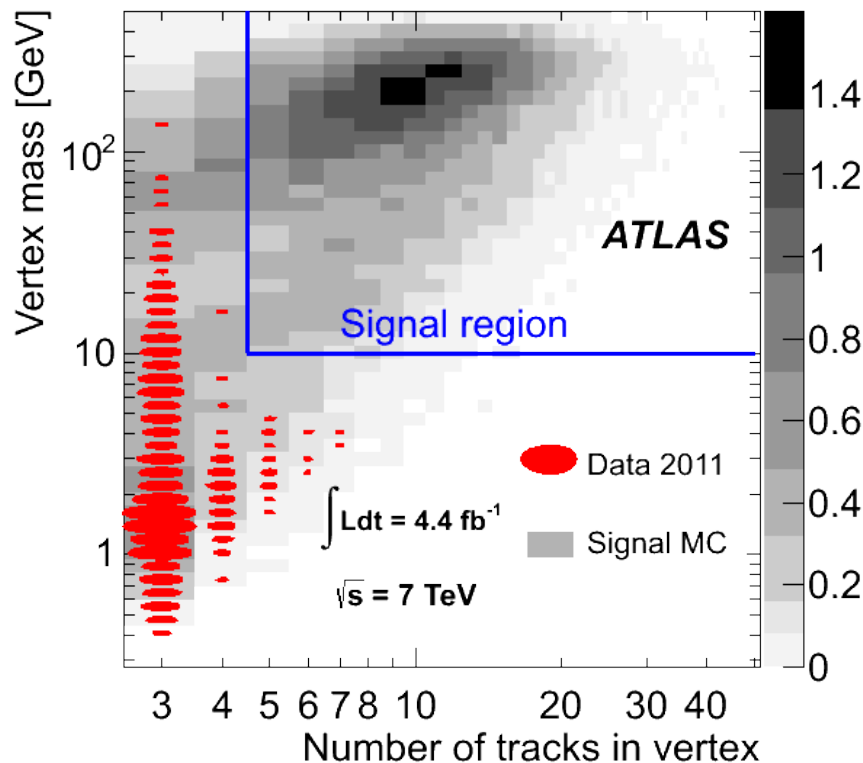

RPV SUSY: Displaced vertex

- Some models predict long lived neutralinos
 - Lifetime of picosecond to nanosecond
 - Decay length mm to many cm
- Look for events with a displaced vertex containing a muon and at least 5 tracks
 - Invariant mass of tracks in vertex required to be above 10 GeV
- Consider two different squark and neutralino masses in 3 combinations

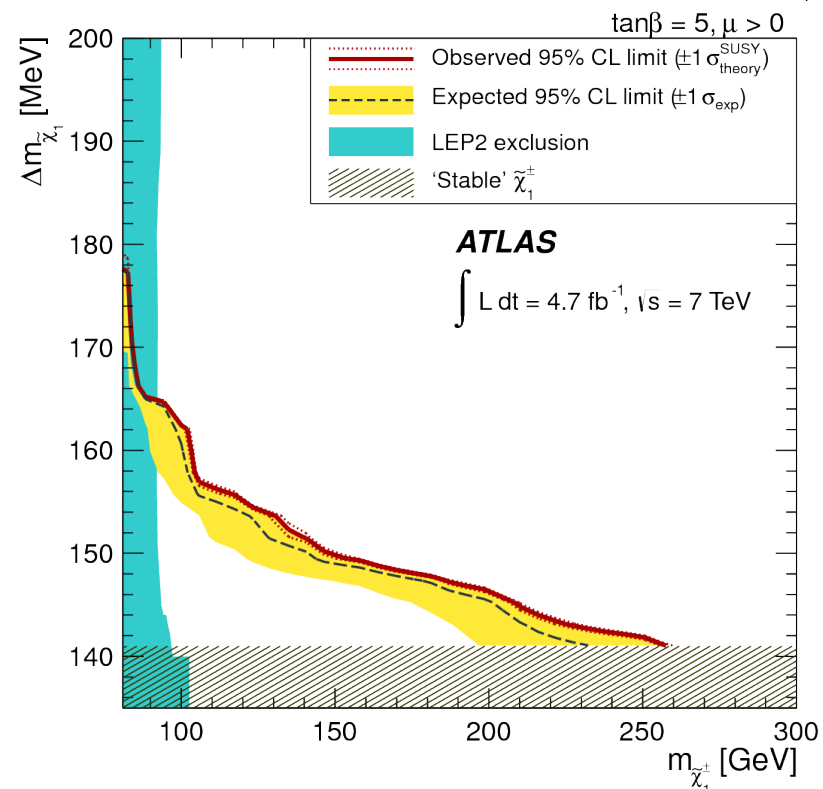

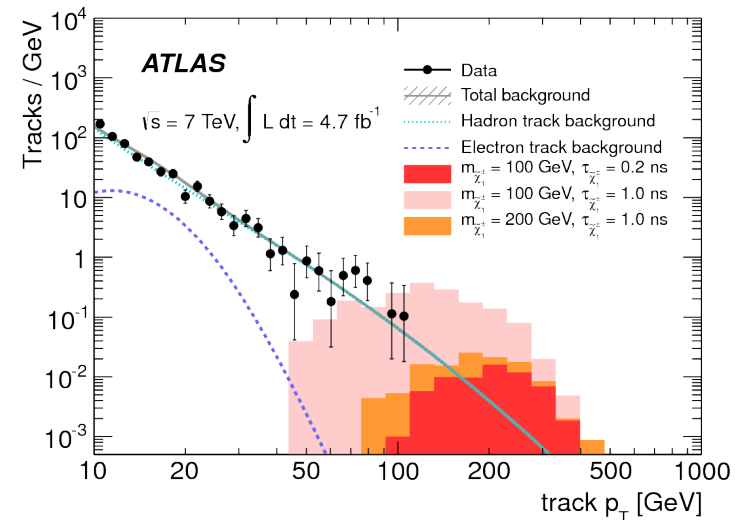

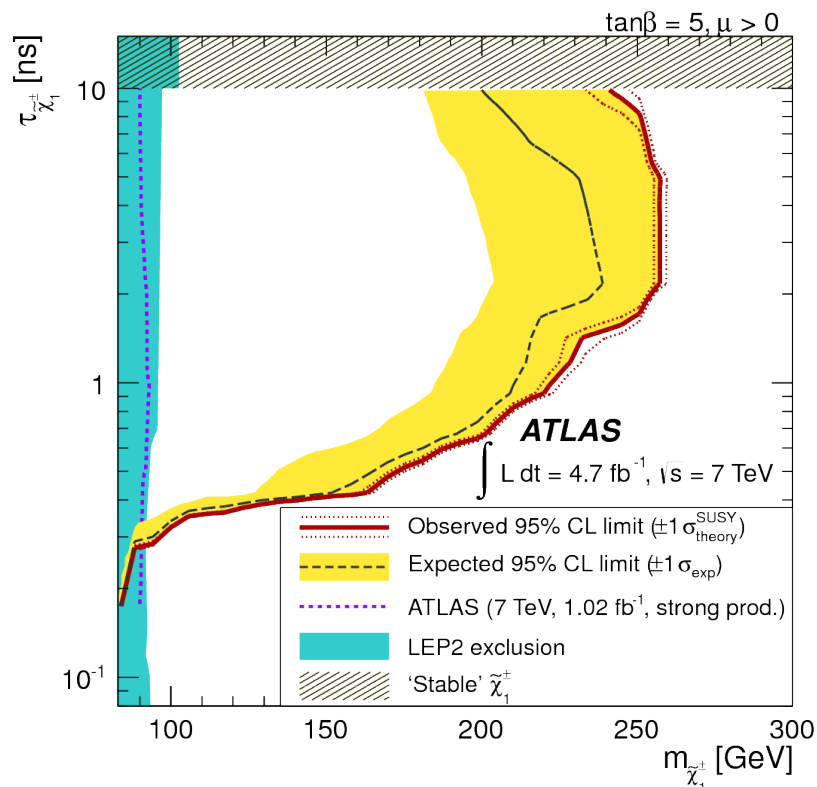

| Sample | $m_{\tilde{q}}$ [GeV] | σ [fb] | $m_{\tilde{\chi}_1^0}$ [GeV] | $\langle\gamma\beta\rangle_{\tilde{\chi}_1^0}$ | $c\tau_{MC}$ [mm] | λ'_{211} $\times 10^{-5}$ |
|--------|--------------------------|------------------|---------------------------------|--|----------------------|--------------------------------------|
| MH | 700 | 66.4 | 494 | 1.0 | 78 | 0.3 |
| ML | 700 | 66.4 | 108 | 3.1 | 101 | 1.5 |
| HH | 1500 | 0.2 | 494 | 1.9 | 82 | 1.5 |

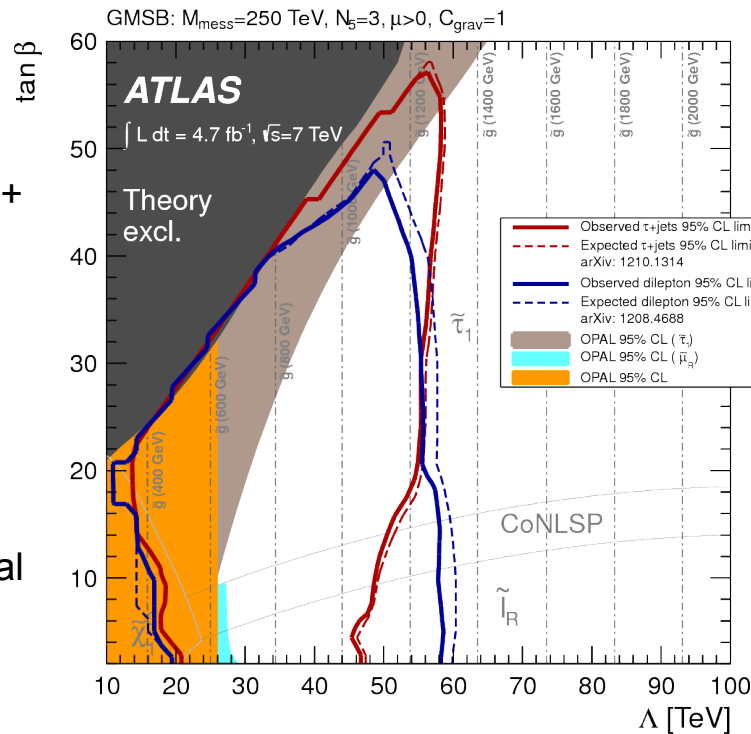

AMSB: Disappearing tracks

- Chargino and neutralino nearly degenerate
 - Very long lived particle
 - Look for a decay inside the tracking volume
- Signature:
 - Jet + MET + high pT disappearing track
 - Jet from ISR used for trigger
- Look for a good track with many good hits in the inner tracking volume but < 5 in the outer module

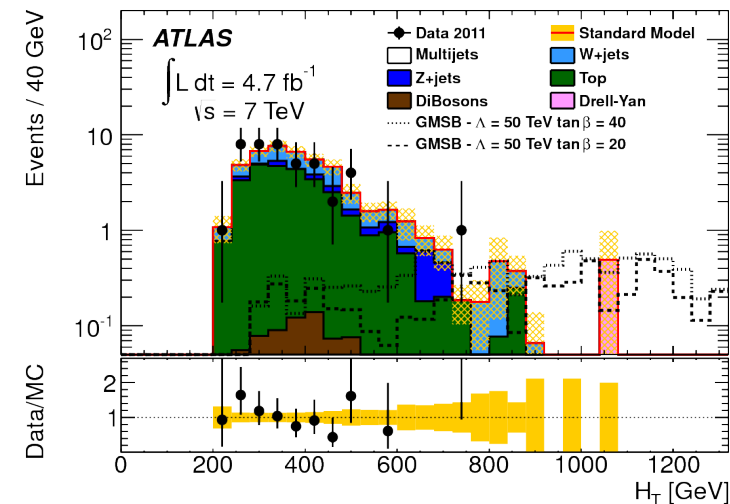

GMSB: MET + Jets + Tau

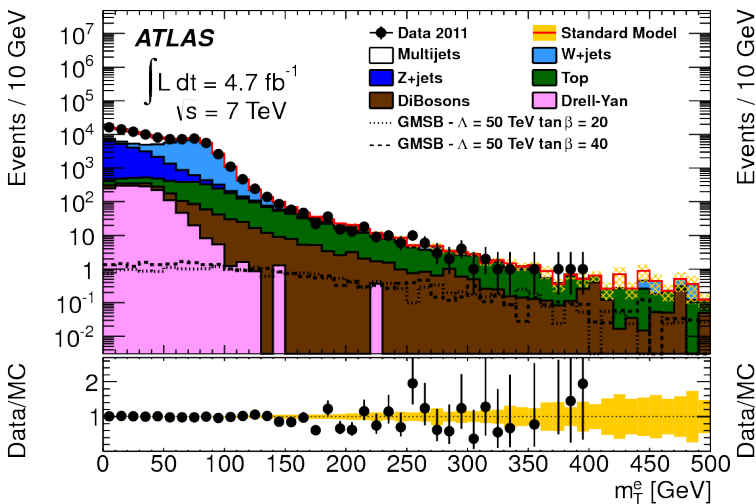

- This analysis assumes NLSP is a stau
 - Decays to gravitino + tau
- Look for events with a tau + leptons
- 4 signal regions
 - 1 tau
 - 2 taus
 - tau+muon
 - tau + electron
- Use MET, HT, and mT to discriminate between signal and background
 - Tune cuts for each signal region separately

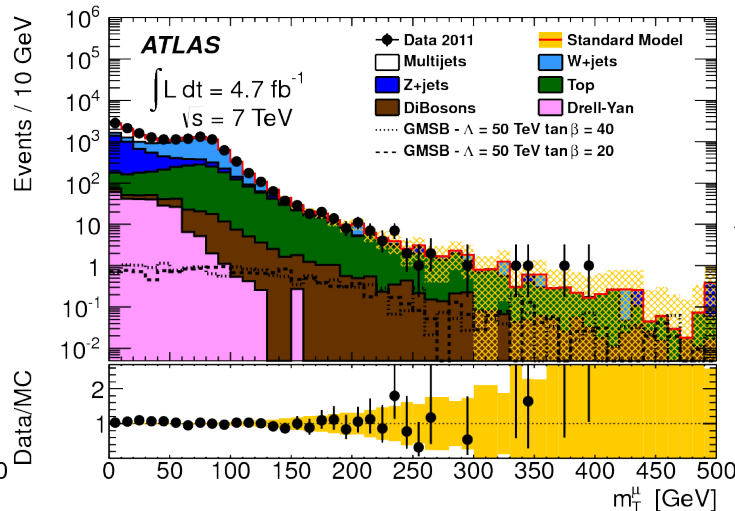

HT for 2 tau final state

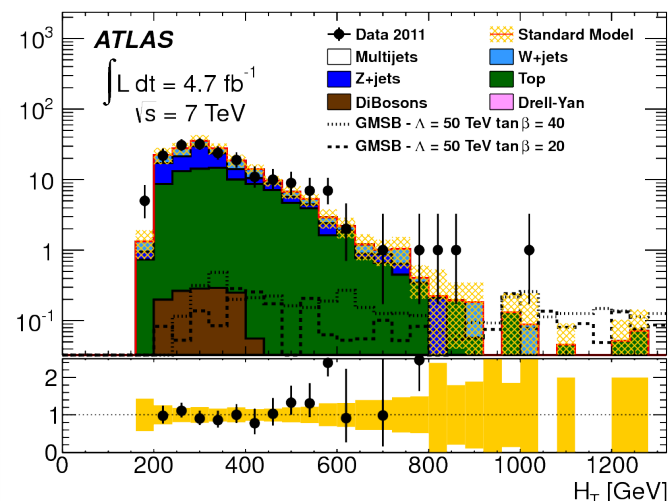

mT in electron channel

mT in muon channel

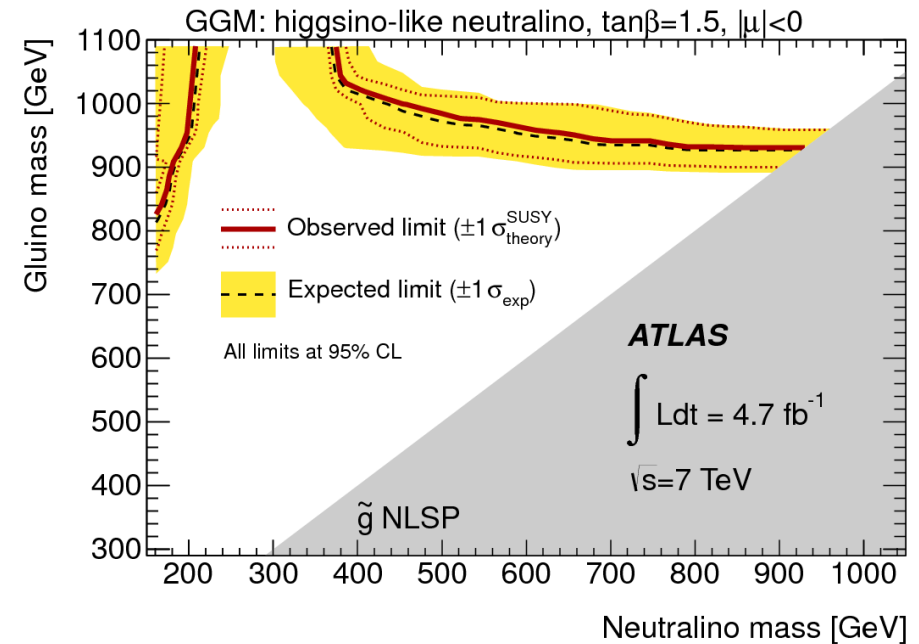

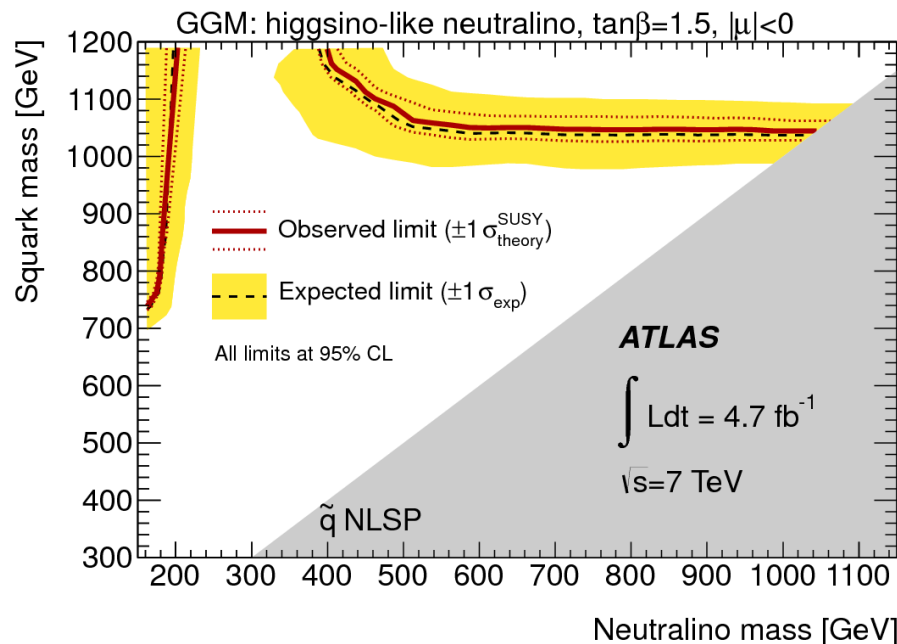

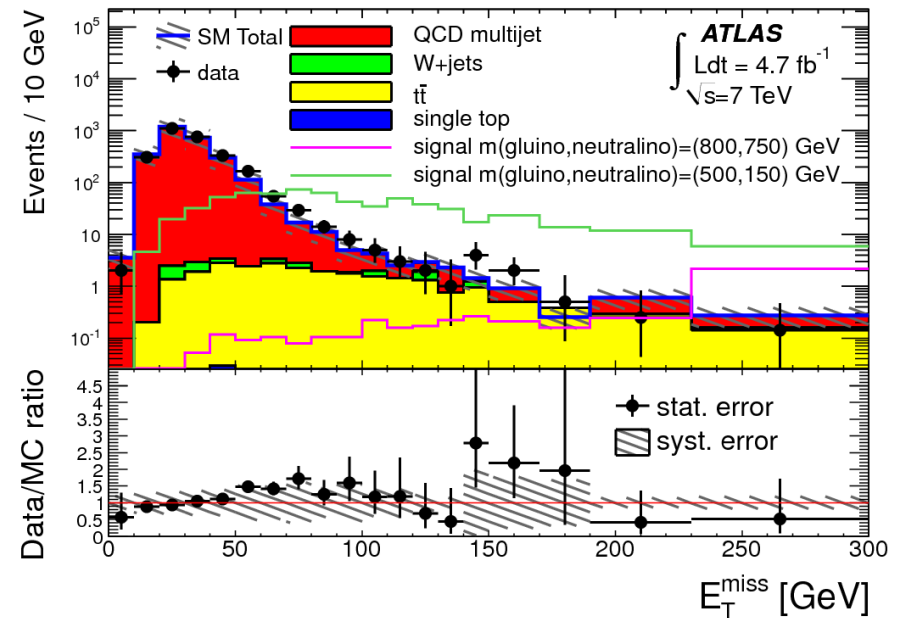

HT for 1 tau final state

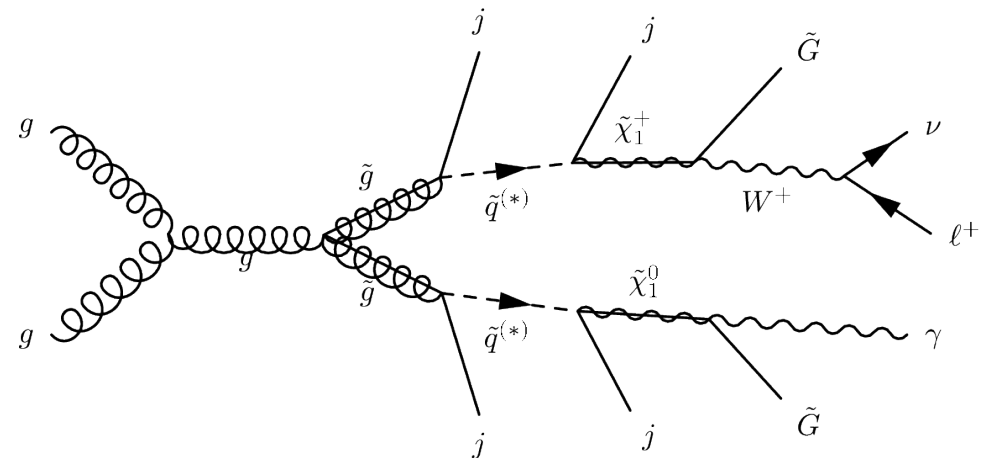

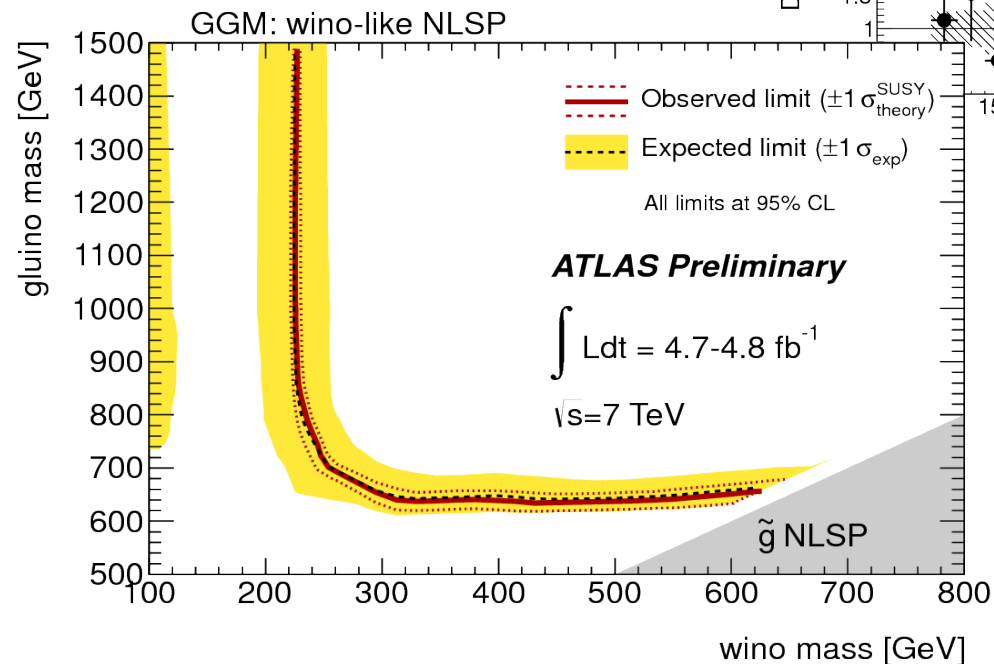

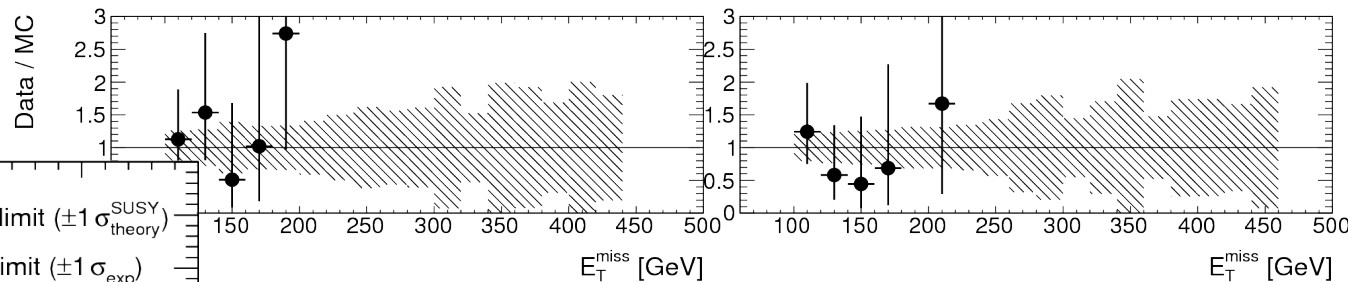

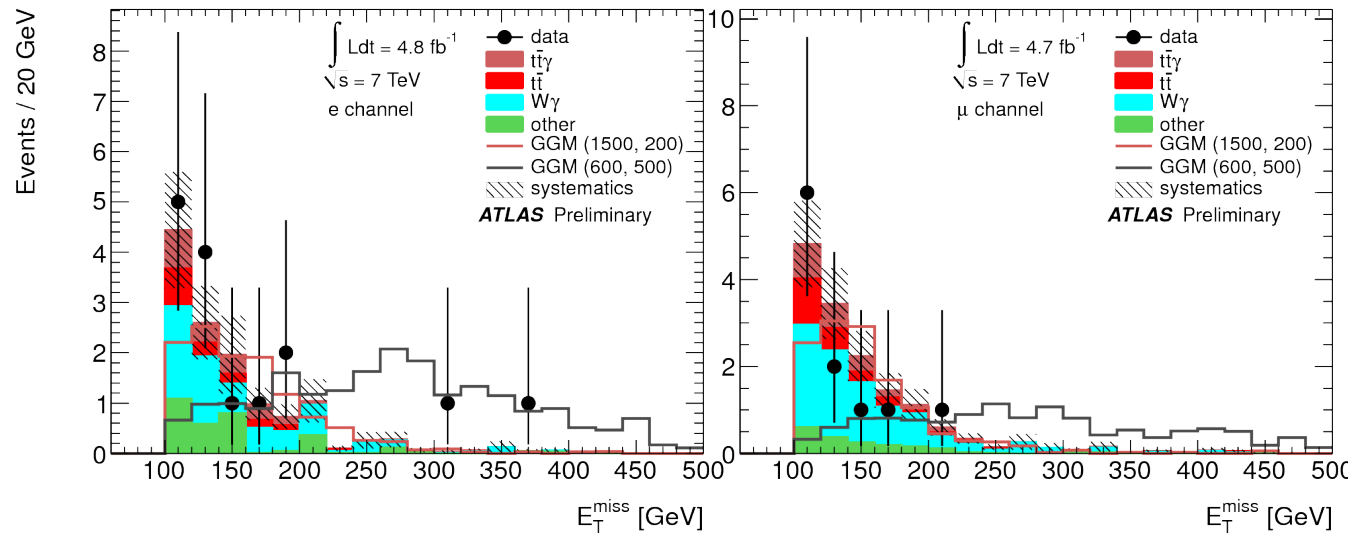

GGM: b-jets + photons + MET

- This analysis assumes NLSP is a neutralino
 - Can decay into photon + LSP
 - Can decay to Higgs \rightarrow b-quarks
- Pair produced
 - Assume one decays in each channel
- Look for events with
 - Exactly 1 photon
 - 2 jets, at least one b-tagged
 - MET > 150 GeV
 - Photon + MET $m_T > 100$ GeV

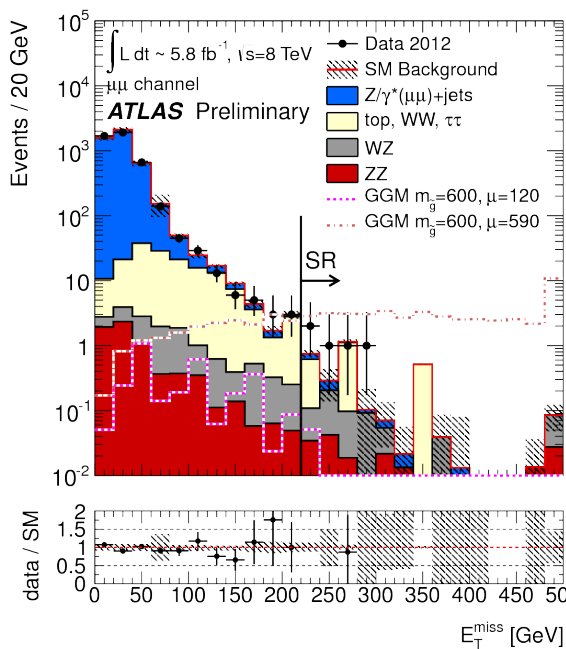

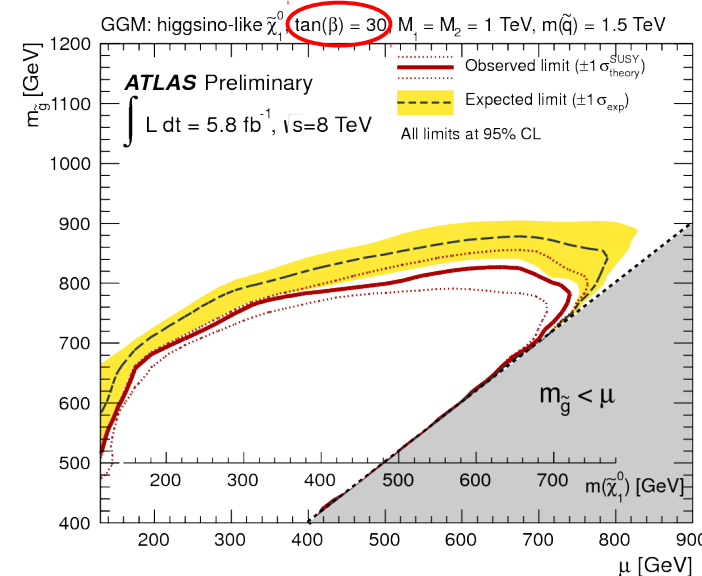

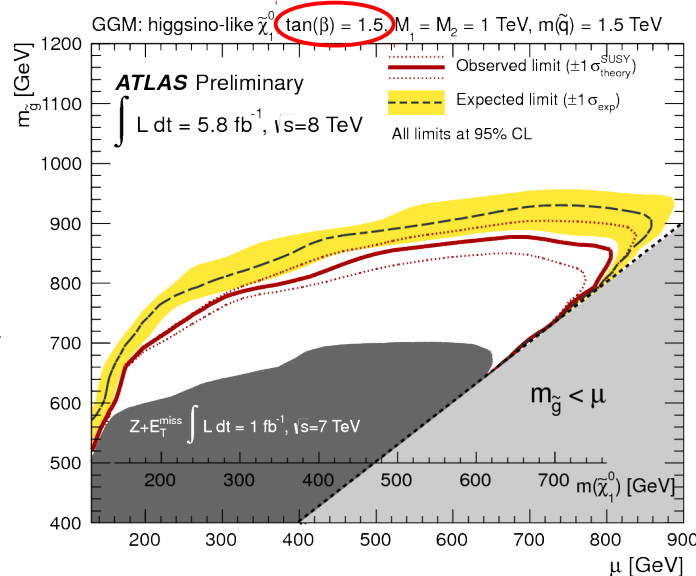

GGM: photon + lepton + MET

- Neutralino and charginos nearly degenerate
 - Chargino decays to gravitino + W
 - Neutralino decays to gravitino + photon (or Z)
- Look for events with a photon, and a W boson
 - $m_T(\text{lepton jet}) > 100 \text{ GeV}$
 - $\text{MET} > 100 \text{ GeV}$

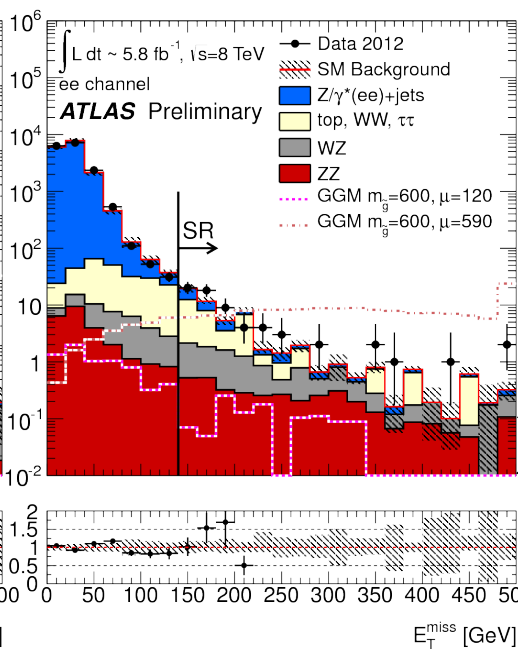

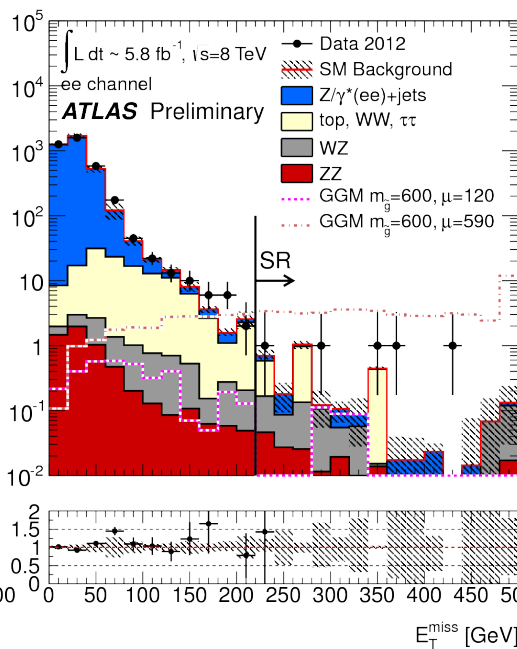

GGM: Z boson + jets + MET

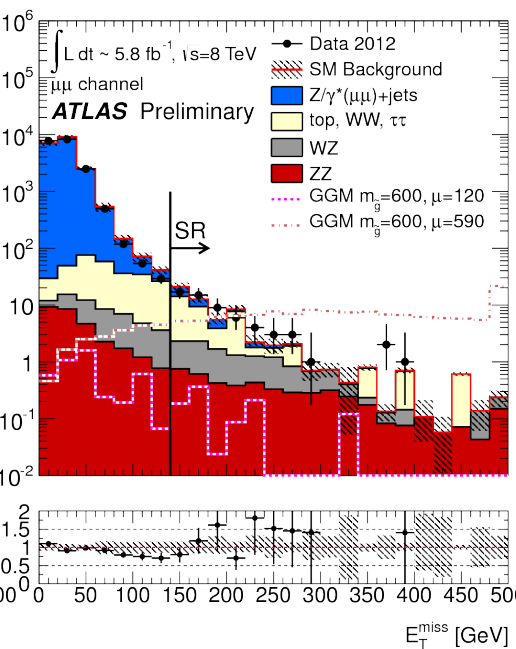

- 8 TeV analysis
- If neutralino is higgsino-like it can decay to gravitino + Z
- 2 overlapping SR. Look for events with:
 - 3 jets (HT > 300)
 - MET > 220 (140)
 - Z boson

3 Jet signal region

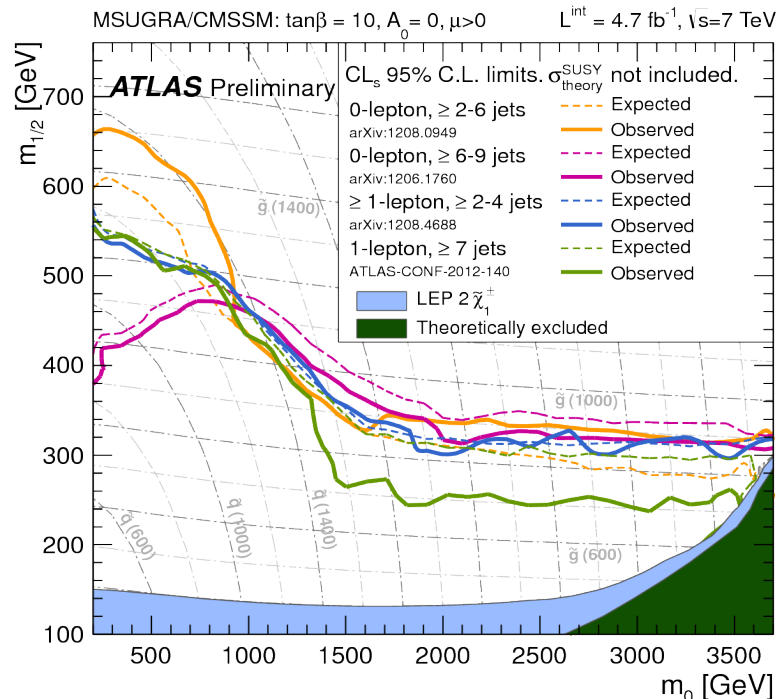

High HT signal region

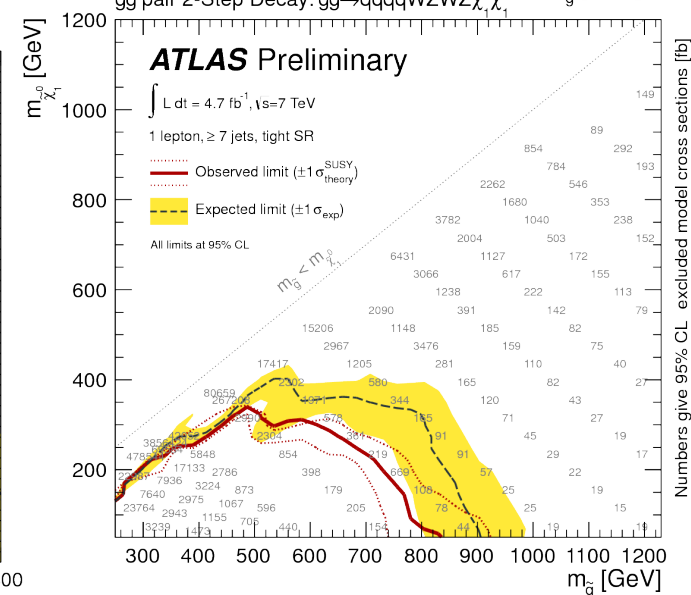

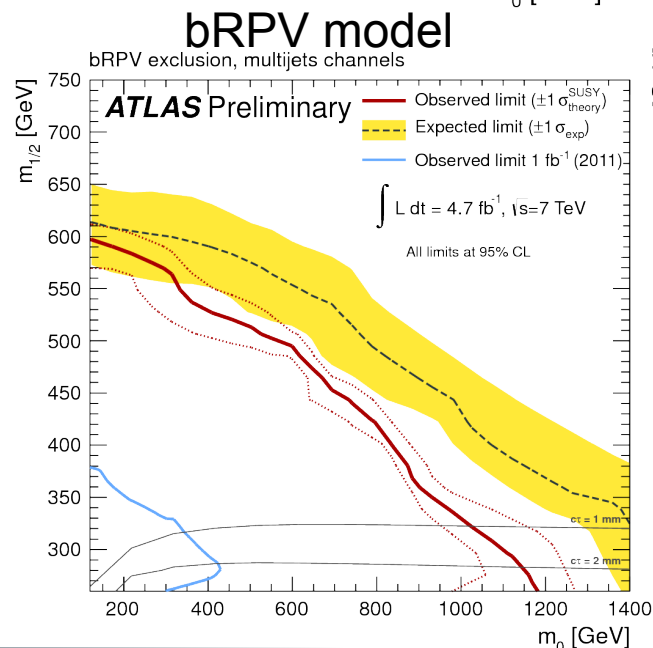

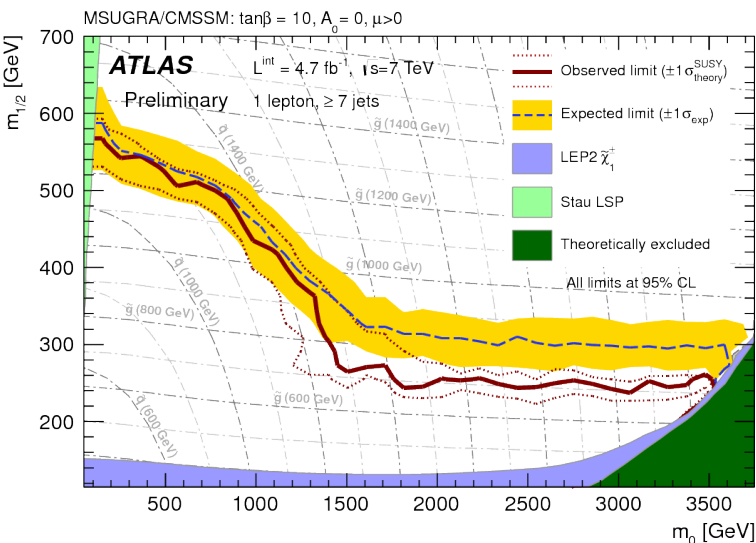

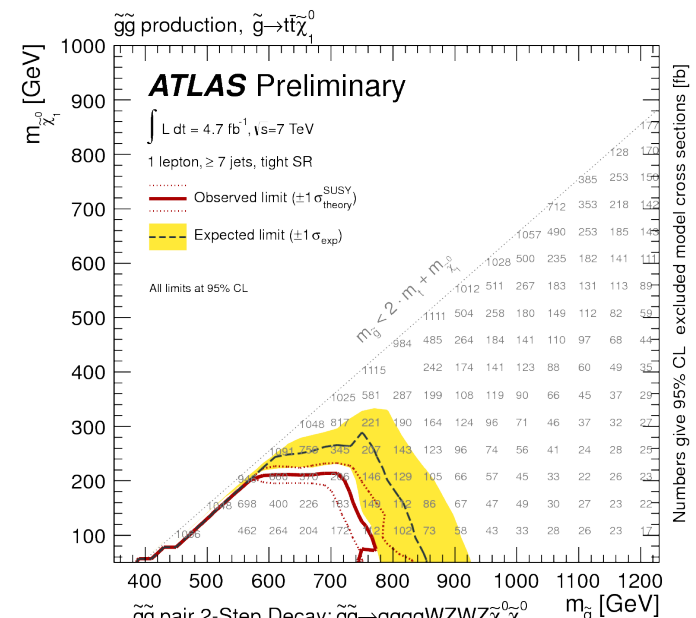

SUSY: Multijet and lepton

- Search uses MSUGRA/CMSSM/ and RPV models
 - SUSY particles decay via a cascade into the LSP
 - Final state has many jets + MET
- Require
 - At least 7 jets
 - MET > 180
 - Meff > 750
 - mT > 120
 - Exactly 1 lepton

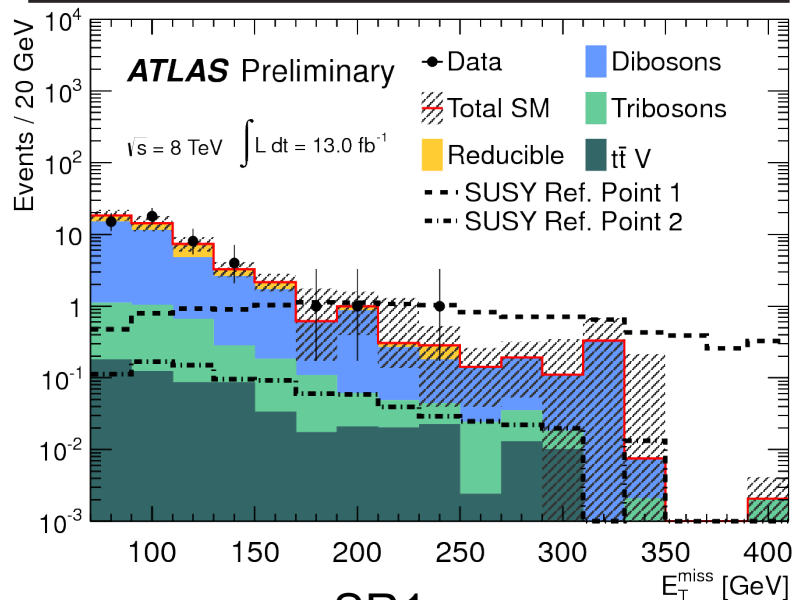

2 step simplified models

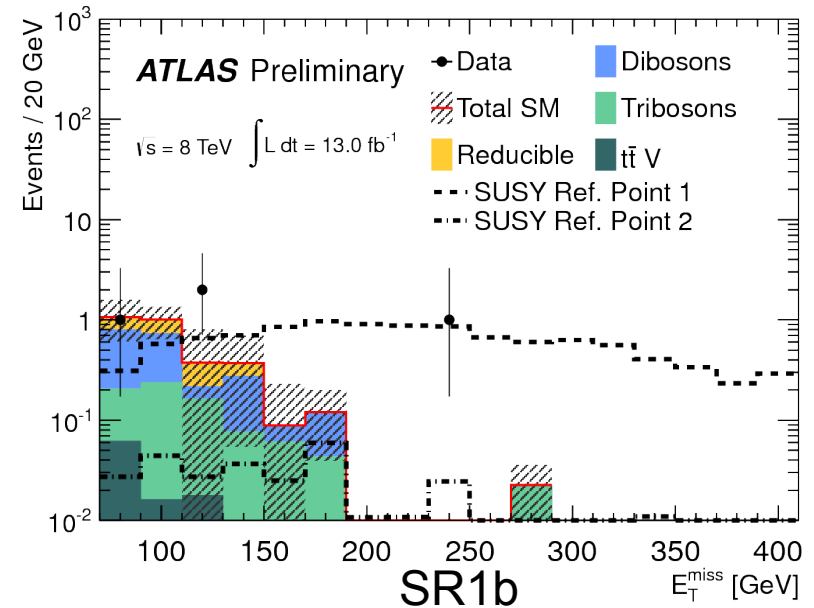

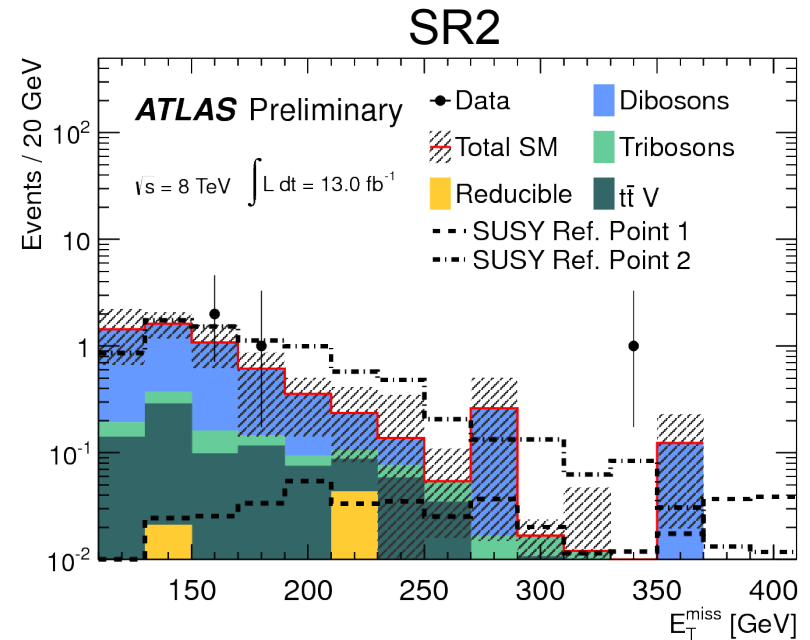

Electroweak SUSY production: 3 lepton channel (1)

- 8 TeV analysis
- Direct production of charginos and neutralinos
 - Can decay to:
 - slepton or sneutrino+lepton
 - slepton + neutrino
 - W or Z + neutralinos
- Look for events with 3 leptons (e/mu)

| Selection | SR1a | SR1b | SR2 |
|-----------------------------------|----------------------------|---------------------|---------------------|
| Targeted $\tilde{\chi}_2^0$ decay | $\tilde{l}^{(*)}$ or Z^* | | on-shell Z |
| $ m_{\text{SFOS}} - m_Z $ | $> 10 \text{ GeV}$ | | $< 10 \text{ GeV}$ |
| Number of b -jets | 0 | | any |
| E_T^{miss} | $> 75 \text{ GeV}$ | | $> 120 \text{ GeV}$ |
| m_T | any | $> 110 \text{ GeV}$ | $> 110 \text{ GeV}$ |
| p_T of leptons | $> 10 \text{ GeV}$ | $> 30 \text{ GeV}$ | $> 10 \text{ GeV}$ |

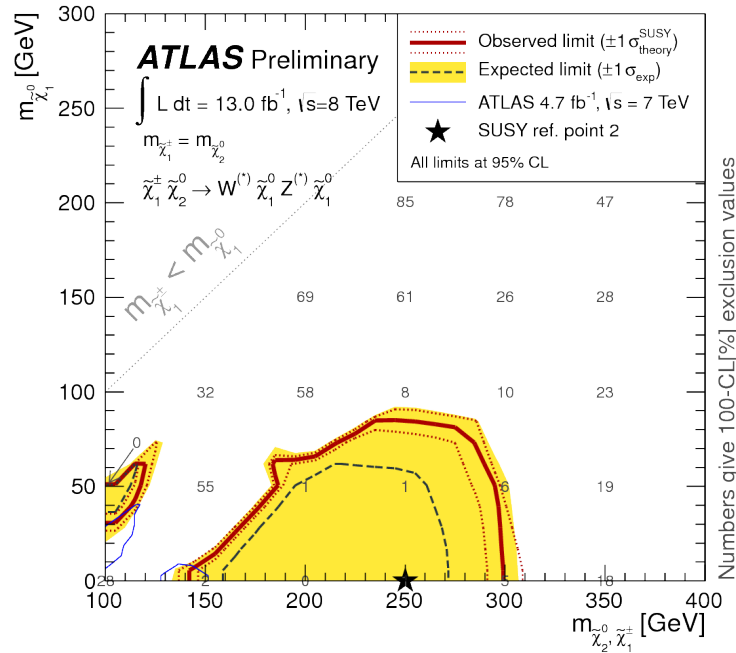

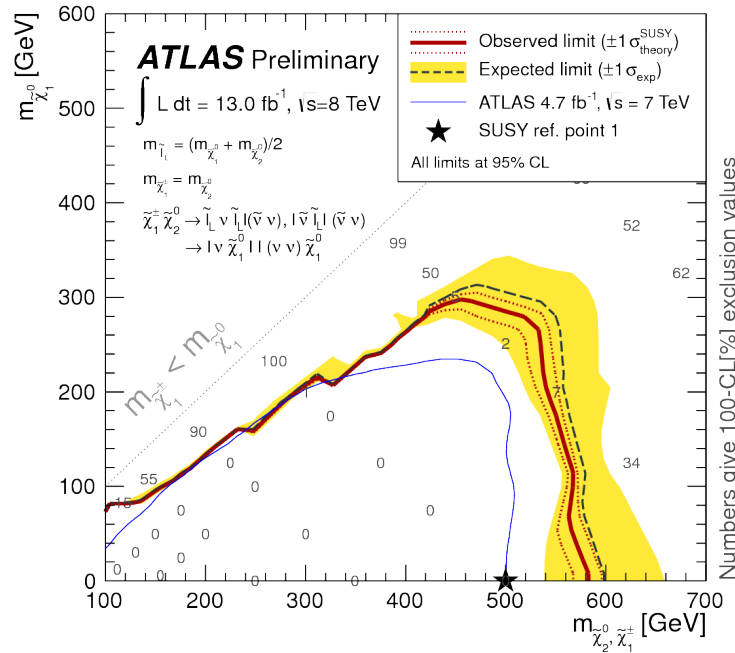

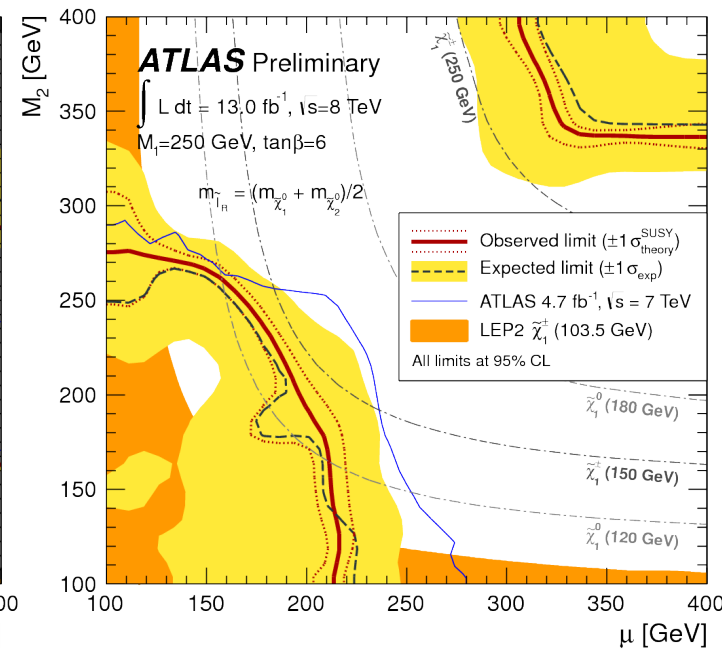

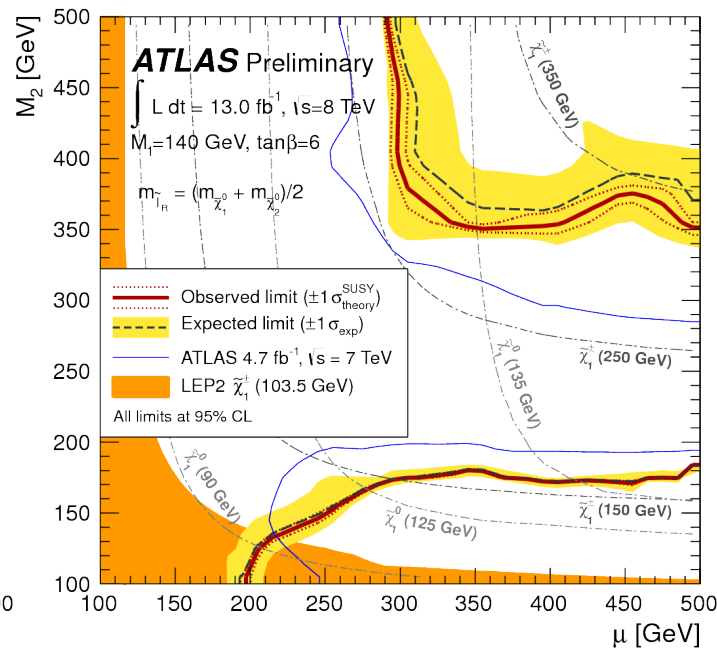

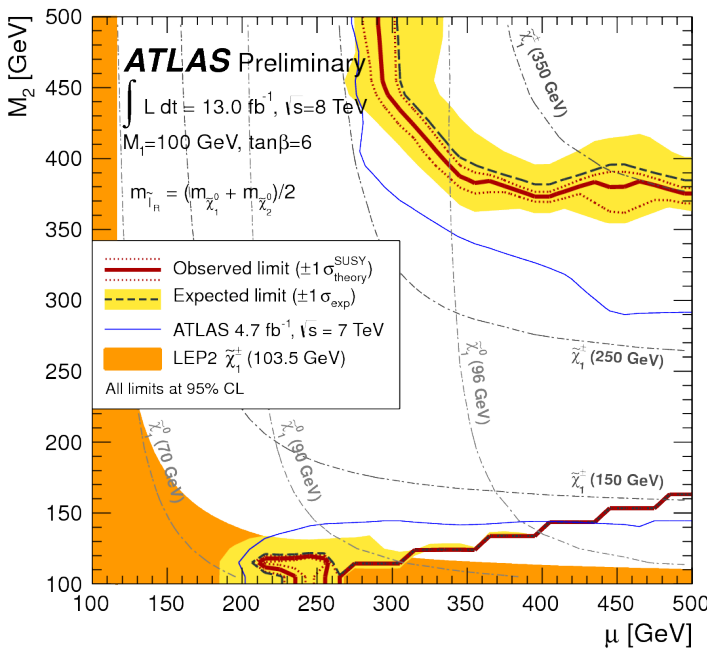

SR1a

SR1b

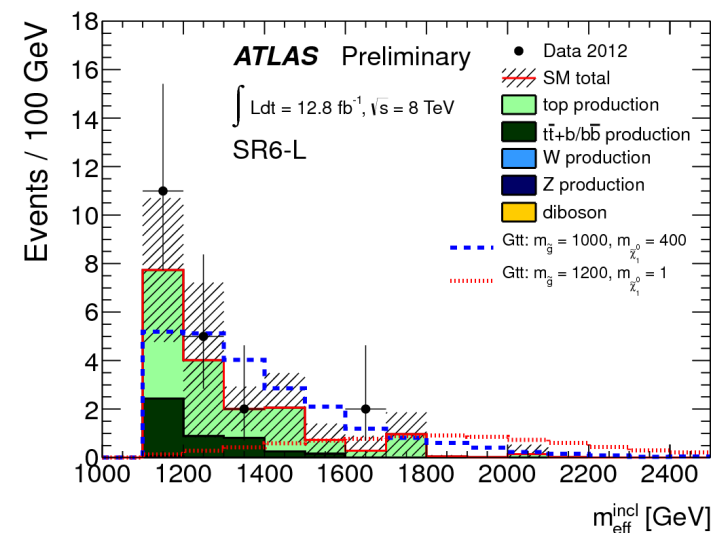

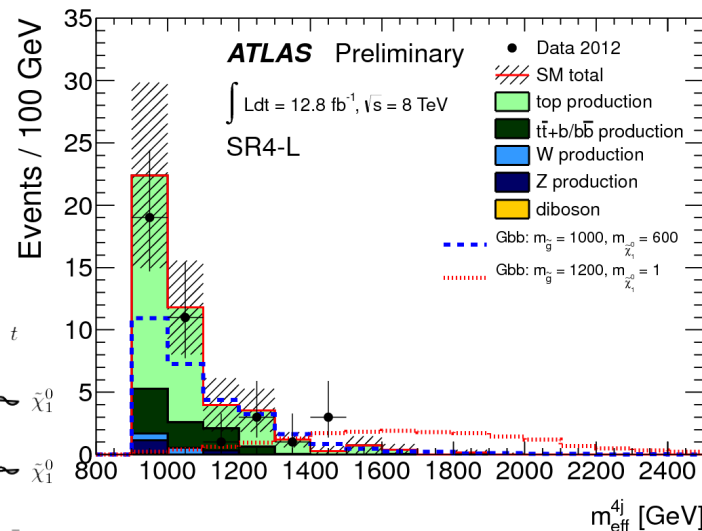

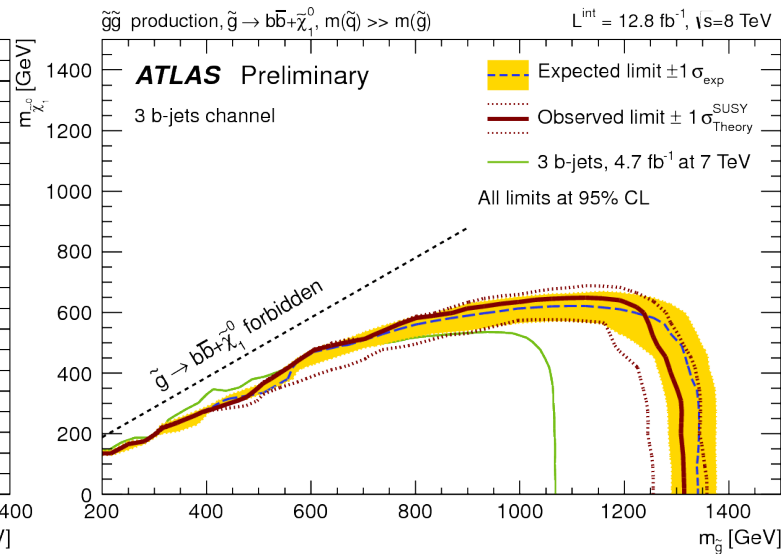

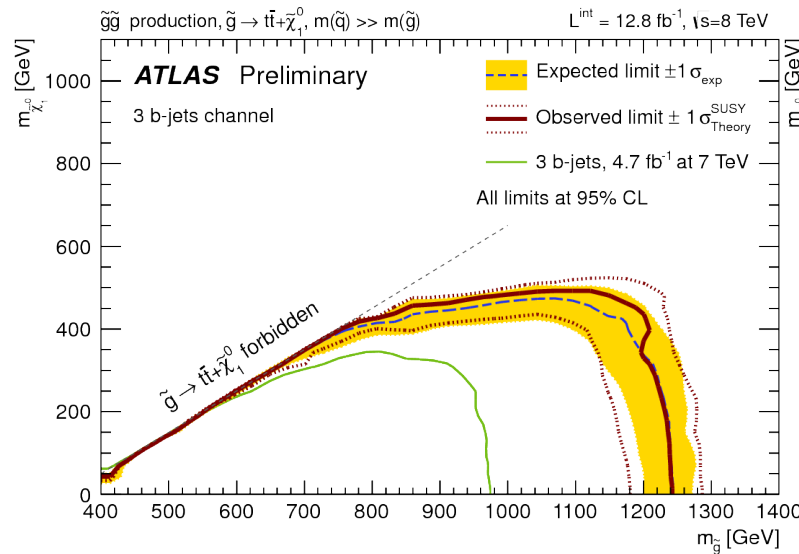

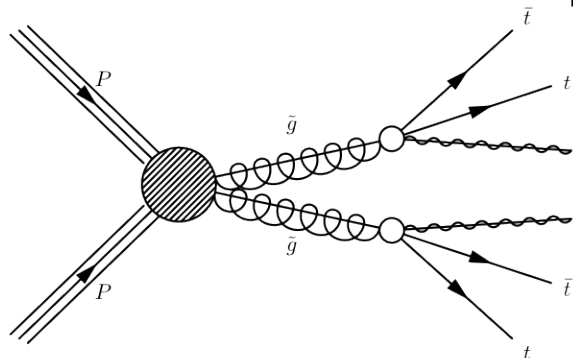

Electroweak SUSY production: 3 lepton channel (1)

- Chargino & neutralino production in pMSSM (top)
 - $M_1=100 \text{ GeV}$ (left)
 - $M_1=140$ (center)
 - $M_1=250$ (right)
- Chargino & neutralino production in simplified model (bottom)
 - Intermediate slepton decay (left)
 - Intermediate gauge boson decay (right)

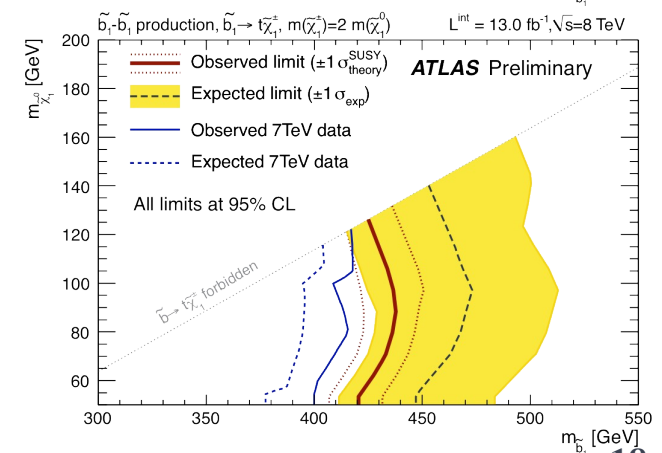

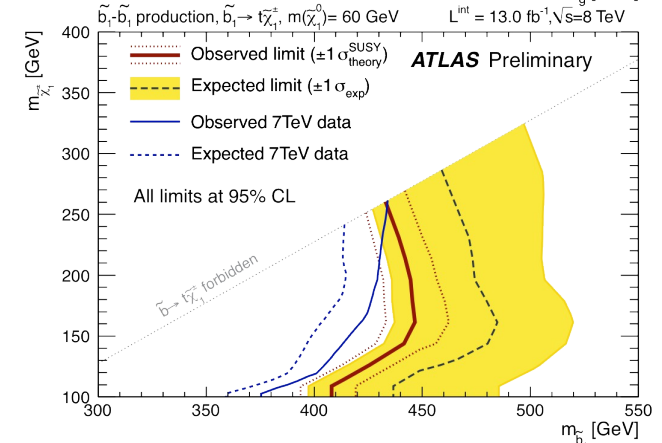

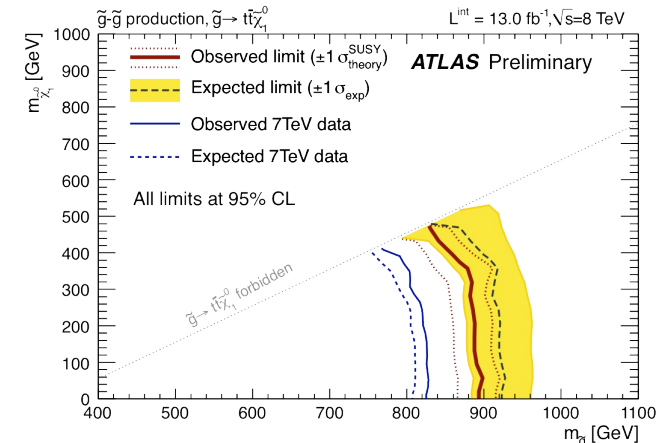

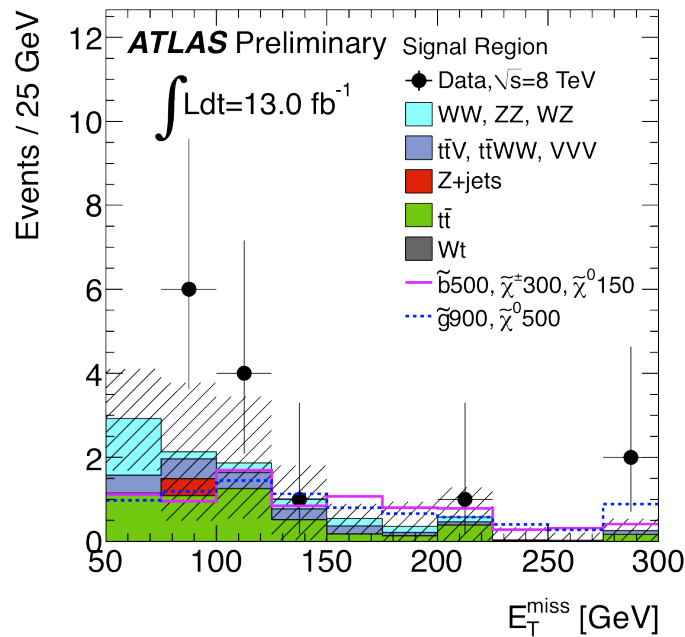

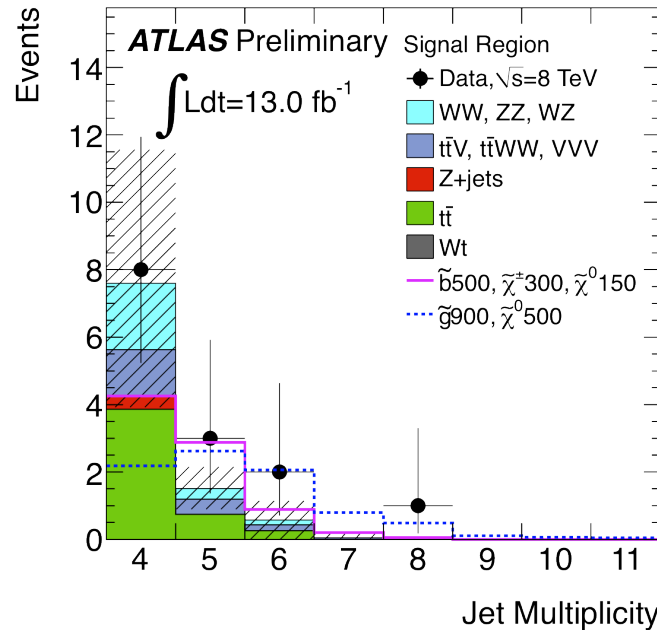

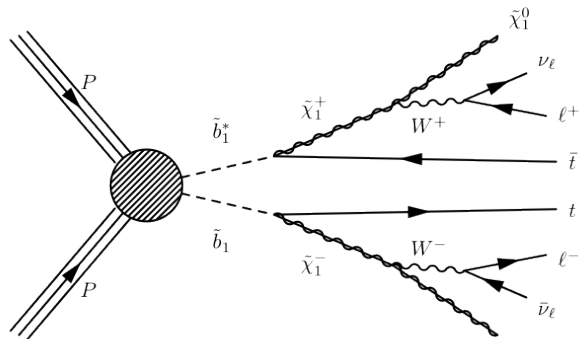

Gluino mediated stop and sbottom: 3 b-jets + MET

- 8 TeV analysis
- Pair produced gluinos
- Gluino decays either to:
 - top+stop+LSP
 - bottom+sbottom+LSP
- Look for events with
 - 3 b-jets
 - MET > 200 GeV
 - MET/Meff > 0.2
 - At least 4 jets and
 - B-jet pT > 50
 - Meff > 900/1100/1300
 - At least 6 jets and
 - B-jet pT > 30
 - Meff > 1100/1300/1500

Gluino mediated stop, direct sbottom: 3 leptons + jets + MET

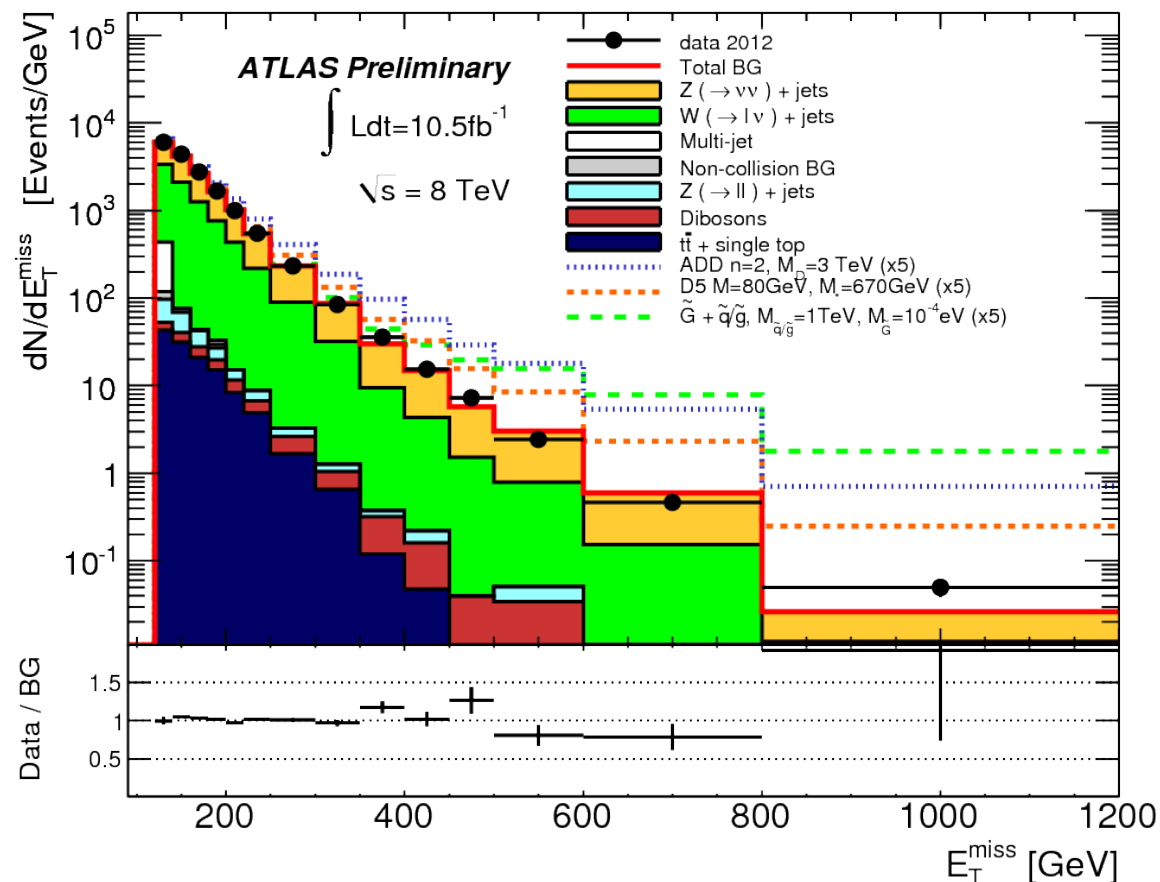

- 8 TeV analysis
- Pair produced gluinos
 - Decays to 4 tops + MET
- Pair produced sbottoms
 - Decays to 2 tops + 2 leptons + MET
- Look for events with
 - At least 3 leptons
 - At least 4 jets
 - MET > 50 GeV
 - No lepton pair consistent with J/Psi or Z boson decay

Monojets + MET (1)

- 8 TeV analysis
- Look for events with one high energy jet + large MET
- Veto on leptons and 3rd jet
- Require second jet to point away from MET
 - Reduces fake MET
- Models producing this signature
 - Large Extra Dimensions (LED)
 - Use model of Arkani-Hamed, Dimopoulos, and Dvali (ADD)
 - Weakly interacting massive particle (WIMP)
 - Dark matter candidate
 - 3 possible couplings of WIMPs to SM particles considered (see below)
 - GMSB SUSY
 - Gravitino + squark/gluino production

| Signal regions | SR1 | SR2 | SR3 | SR4 |
|--|--|---------|---------|---------|
| Common requirements | Data quality + trigger + vertex + jet quality + $ \eta^{\text{jet1}} < 2.0 + \Delta\phi(\mathbf{p}_T^{\text{miss}}, \mathbf{p}_T^{\text{jet2}}) > 0.5 + N_{\text{jets}} \leq 2 +$ lepton veto | | | |
| $E_T^{\text{miss}}, p_T^{\text{jet1}} >$ | 120 GeV | 220 GeV | 350 GeV | 500 GeV |

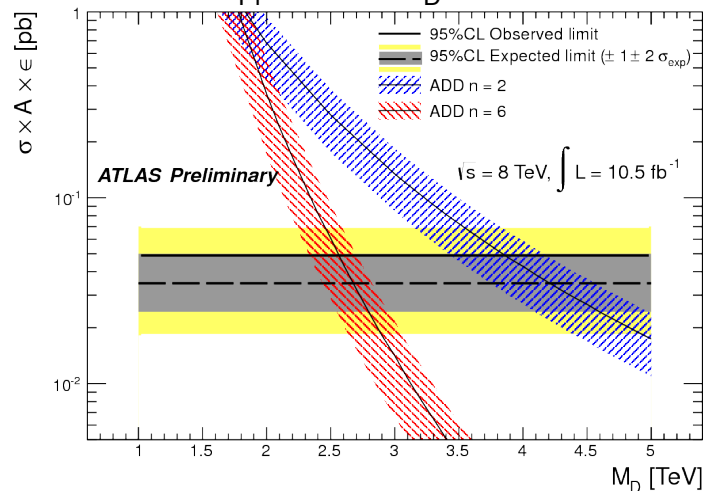

| Name | Initial state | Type | Operator |
|------|---------------|--------------|---|
| D5 | qq | vector | $\frac{1}{M_*^2} \bar{\chi} \gamma^\mu \chi \bar{q} \gamma_\mu q$ |
| D8 | qq | axial-vector | $\frac{1}{M_*^2} \bar{\chi} \gamma^\mu \gamma^5 \chi \bar{q} \gamma_\mu \gamma^5 q$ |
| D11 | gg | scalar | $\frac{1}{4M_*^3} \bar{\chi} \chi \alpha_s (G_{\mu\nu}^a)^2$ |

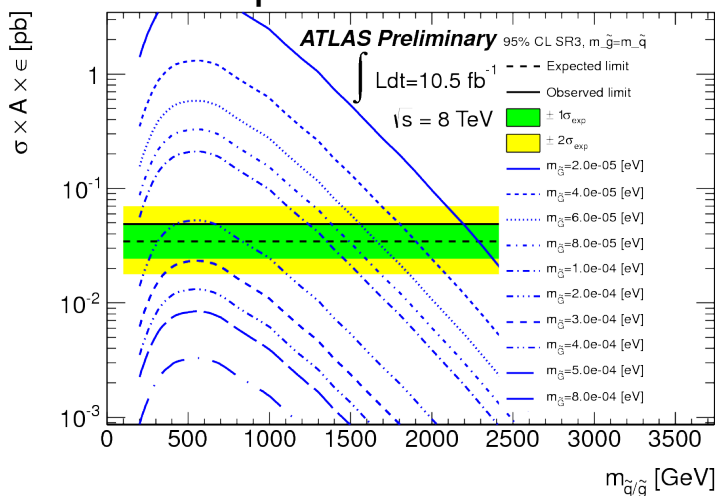

Monojets + MET (2)

Large Extra Dimensions

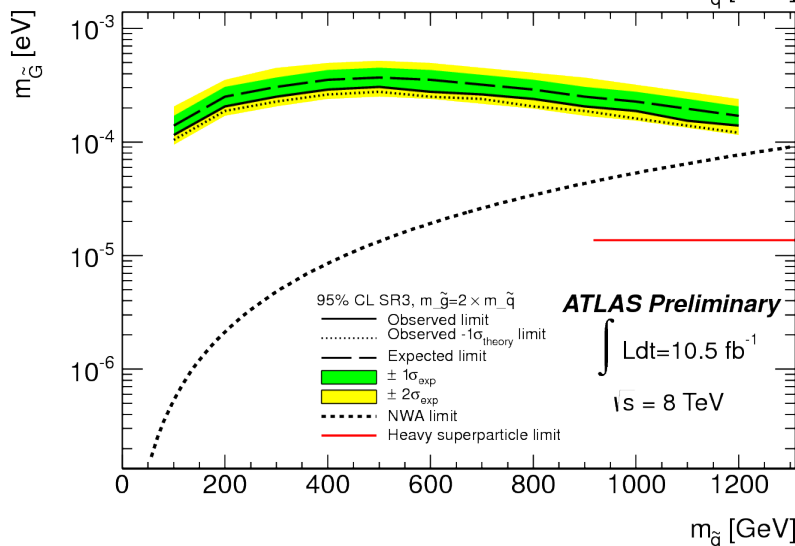

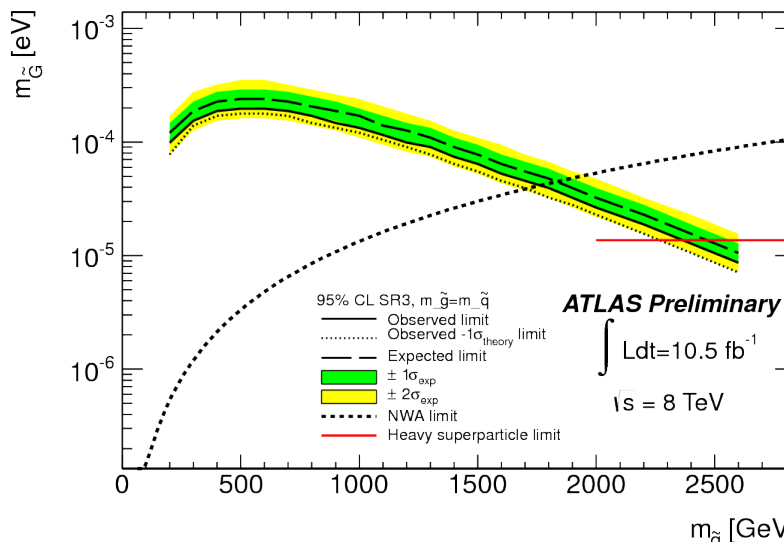

$$M_{\text{Pl}}^2 = 8\pi M_D^{2+n} R^n$$

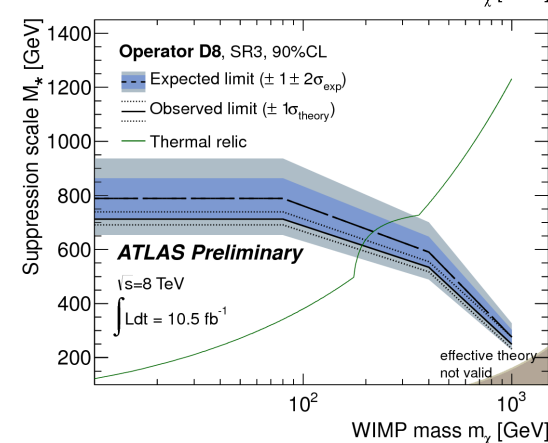

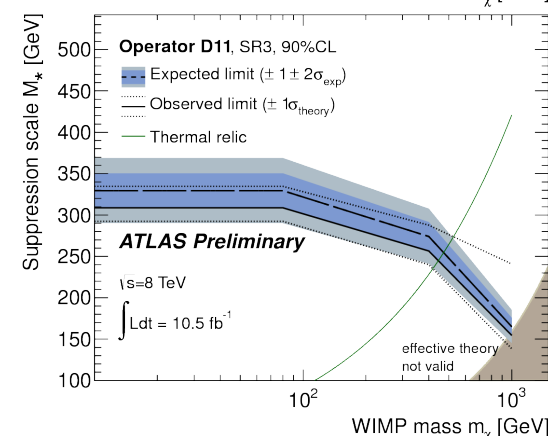

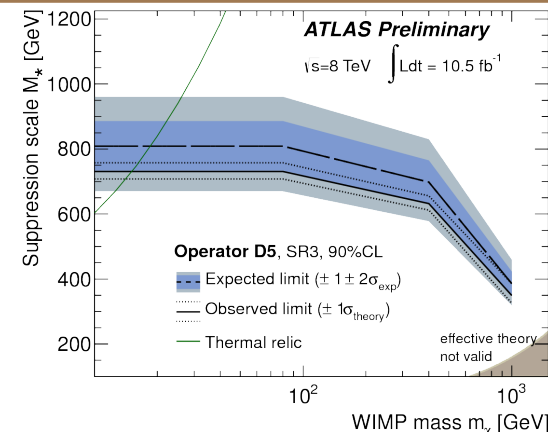

gravitino + squark/gluino production limit

Gravitino mass vs squark mass

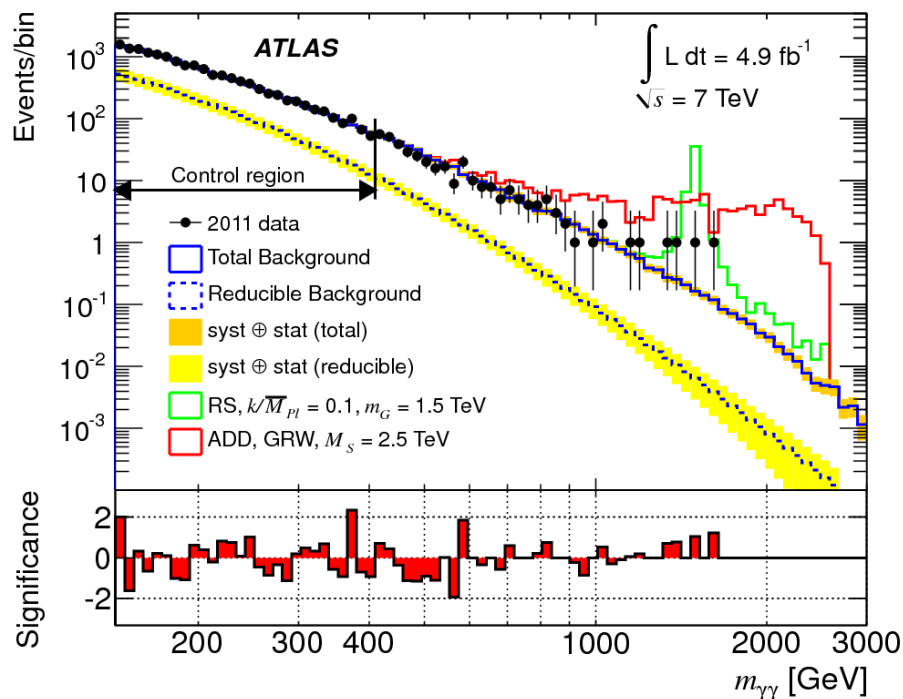

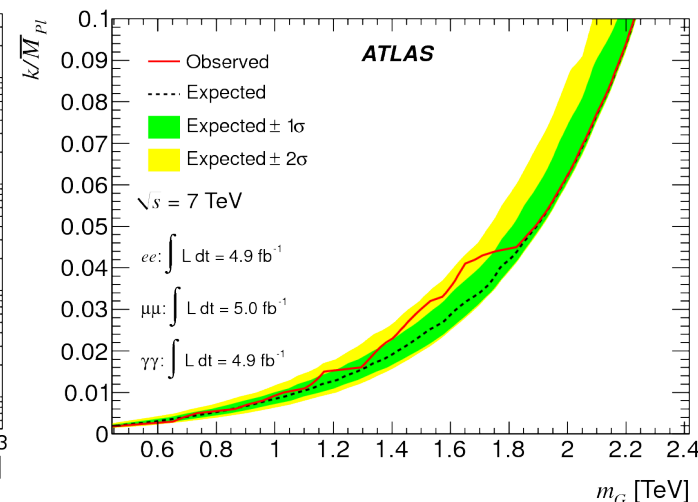

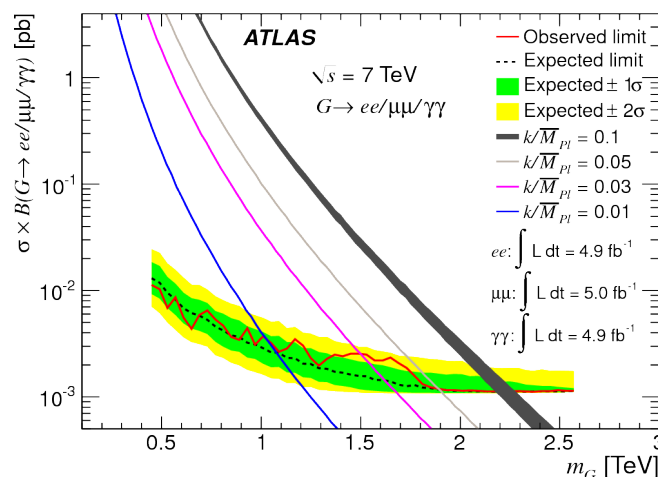

WIMPS Split by operator

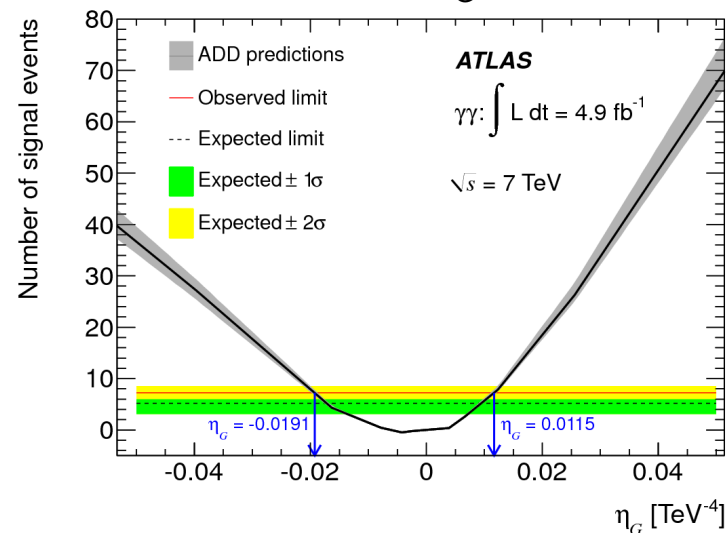

Extra Dimensions: Diphoton channel

- Two LED models considered here:
 - Randall-Sundrum (RS)
 - Arkani-Hamed, Dimopoulos, and Davali (ADD)
- Both predict a graviton decaying to a pair of photons
- Pick events with a pair of high p_T photons
 - Require both to be very cleanly identified
- Use BumpHunter to scan the diphoton invariant mass distribution

Graviton mass (m_G limits) in RS model

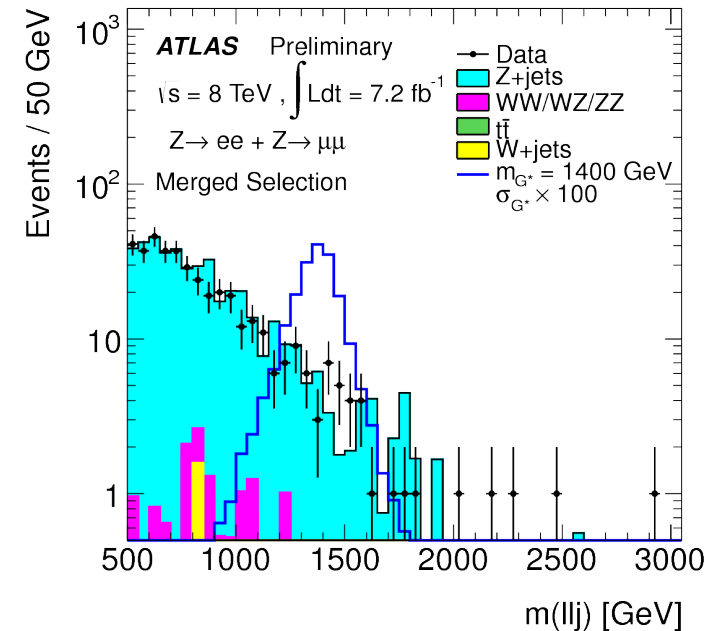

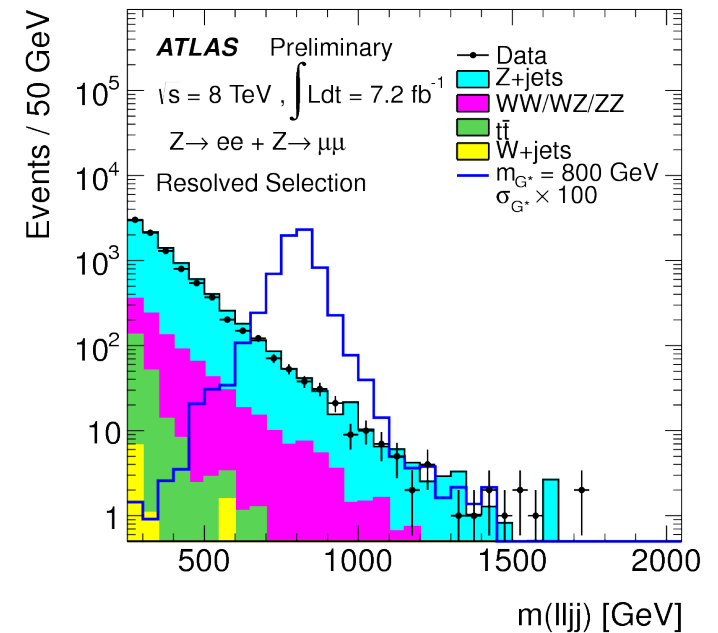

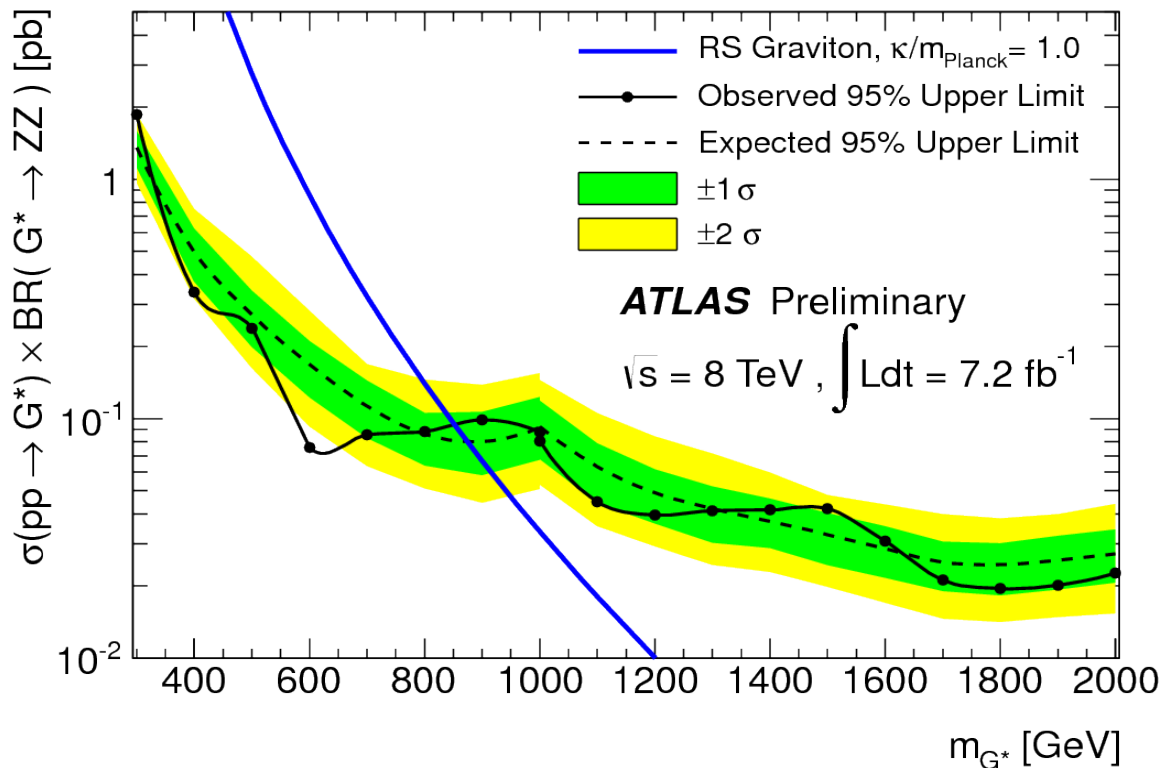

Strength of gravity (η_G) in ADD model

Extra Dimensions: Diboson channel

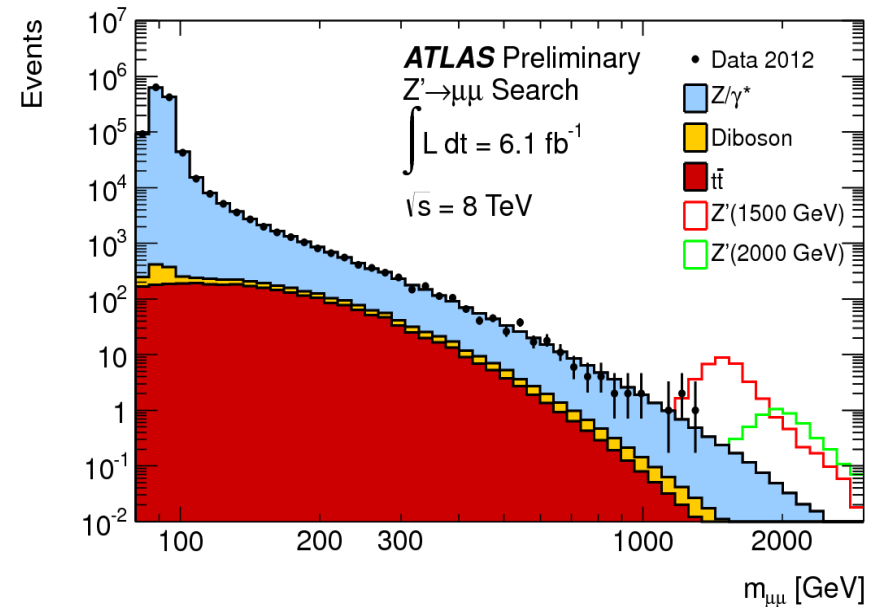

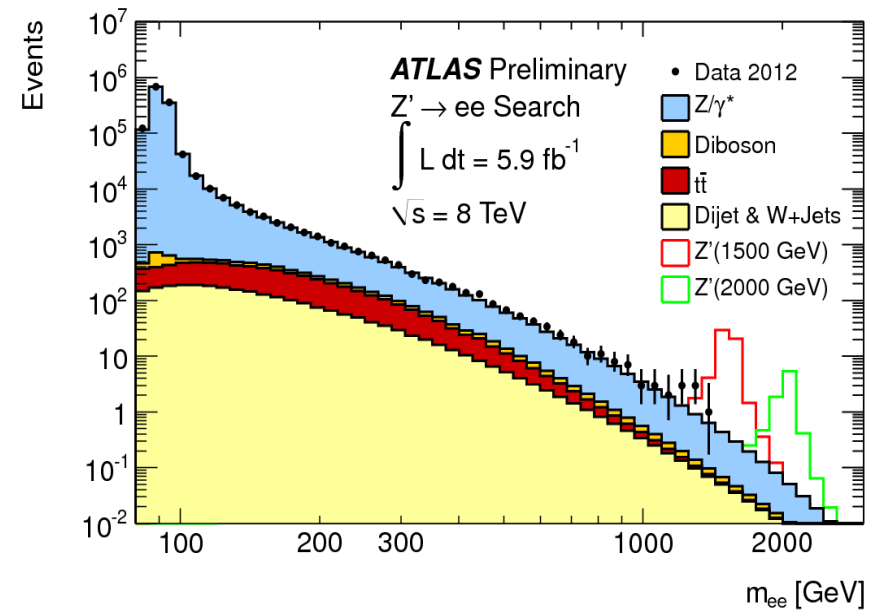

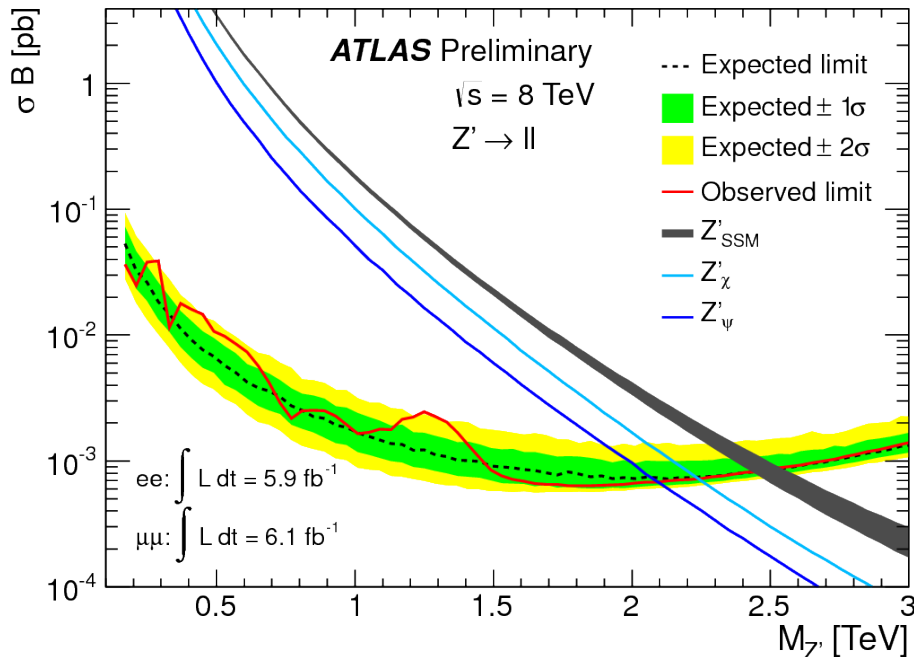

- 8 TeV analysis
- Look for RS graviton decaying to a ZZ pair
 - $ZZ \rightarrow llqq$ channel
- Look for events with:
 - 2 same flavor leptons
 - 1 (merged) or 2 (resolved) jets
 - 2 jets with a mass near the Z mass
 - 1 jet with mass > 40 GeV
- Form invariant mass of 2 leptons and jet(s)

Z' Boson: electron/muon channel

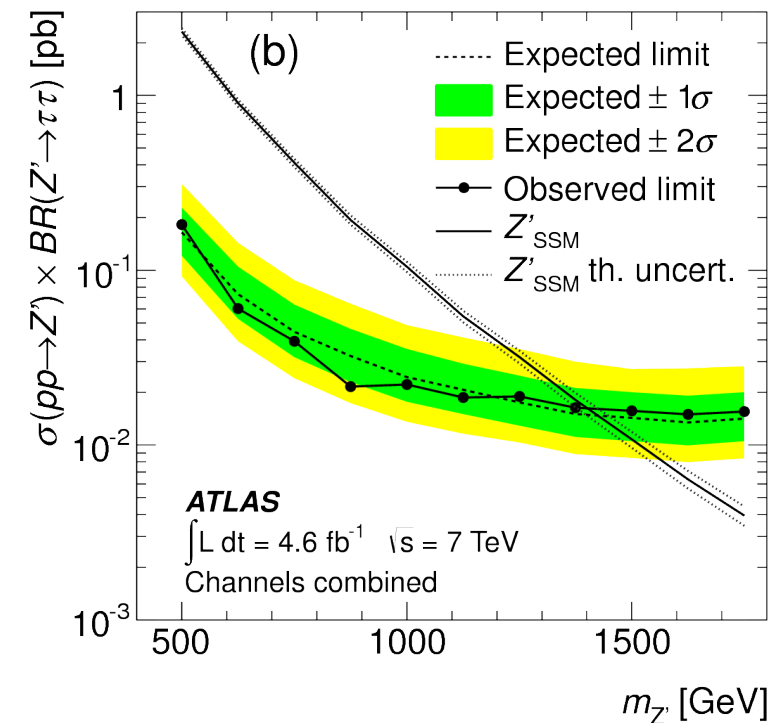

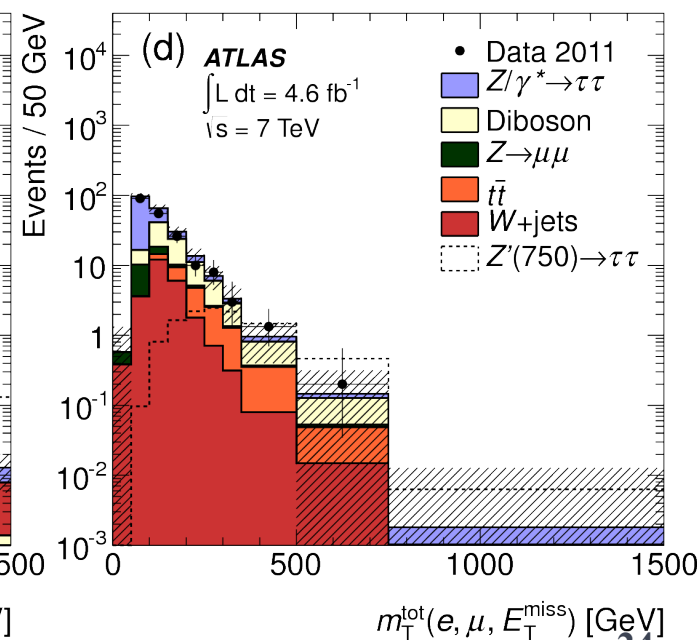

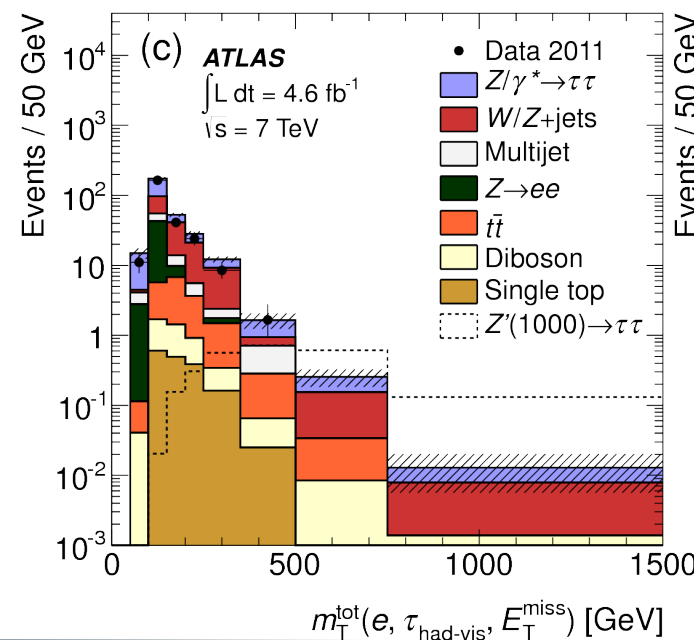

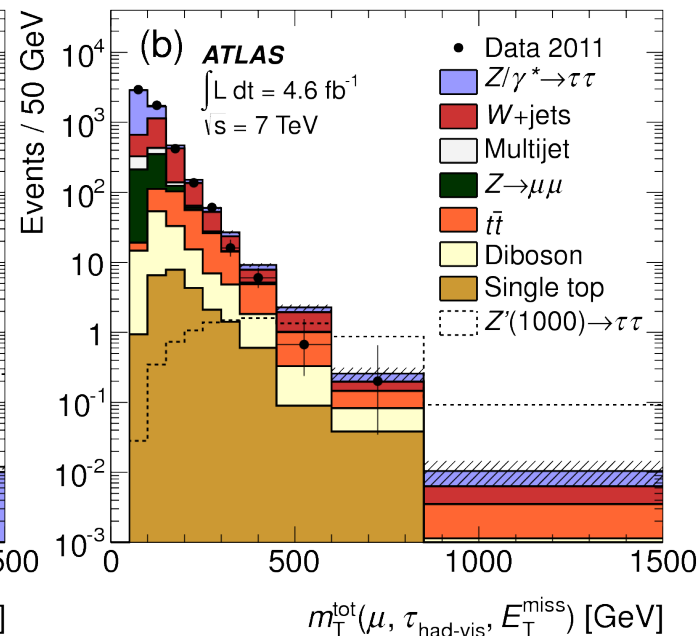

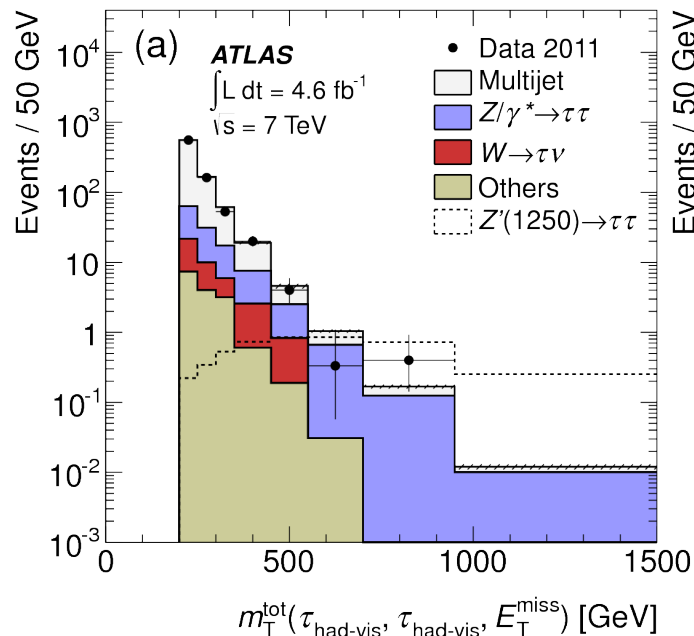

- 8 TeV update
- Search for heavy Z-like boson
 - Look for $Z' \rightarrow ee$ or $\mu\mu$ decays
 - Select events with a pair of high p_T electrons or muons
- Form dilepton invariant mass

| m_{ee} [GeV] | 110 - 200 | 200 - 400 | 400 - 800 | 800 - 1200 | 1200 - 3000 |
|----------------|------------------|----------------|----------------|-----------------|-------------------|
| Z/γ^* | 36200 ± 1500 | 4330 ± 180 | 412 ± 20 | 21.6 ± 1.5 | 3.03 ± 0.35 |
| $t\bar{t}$ | 2190 ± 250 | 750 ± 130 | 53 ± 19 | 0.86 ± 0.18 | 0.041 ± 0.017 |
| W + jets | 470 ± 130 | 130 ± 40 | 10.6 ± 3.0 | 0.30 ± 0.09 | 0.026 ± 0.009 |
| Diboson | 482 ± 34 | 172 ± 22 | 21 ± 8 | 0.91 ± 0.05 | 0.117 ± 0.014 |
| Dijet | 720 ± 240 | 250 ± 120 | 34 ± 23 | 2.1 ± 2.0 | 0.4 ± 0.5 |
| Total | 40100 ± 1600 | 5620 ± 260 | 530 ± 40 | 25.8 ± 2.5 | 3.6 ± 0.6 |
| Data | 39875 | 5760 | 615 | 31 | 5 |

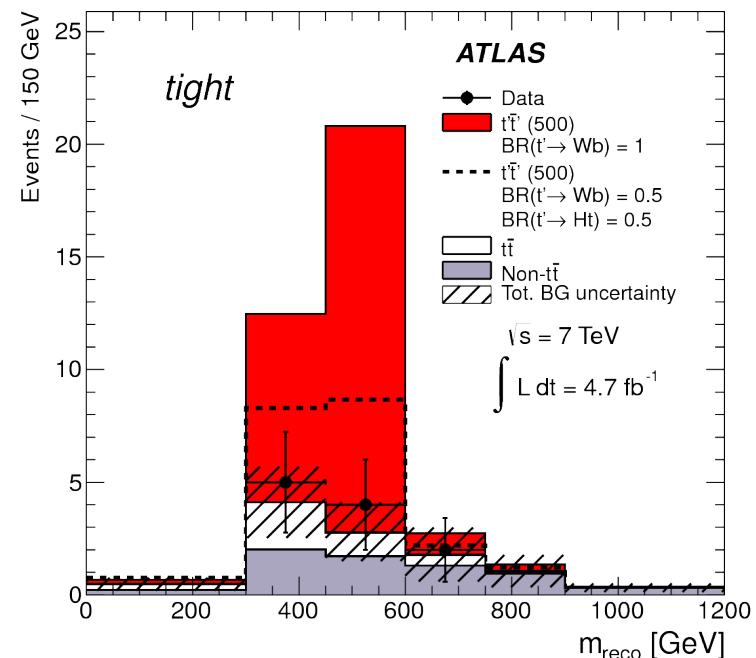

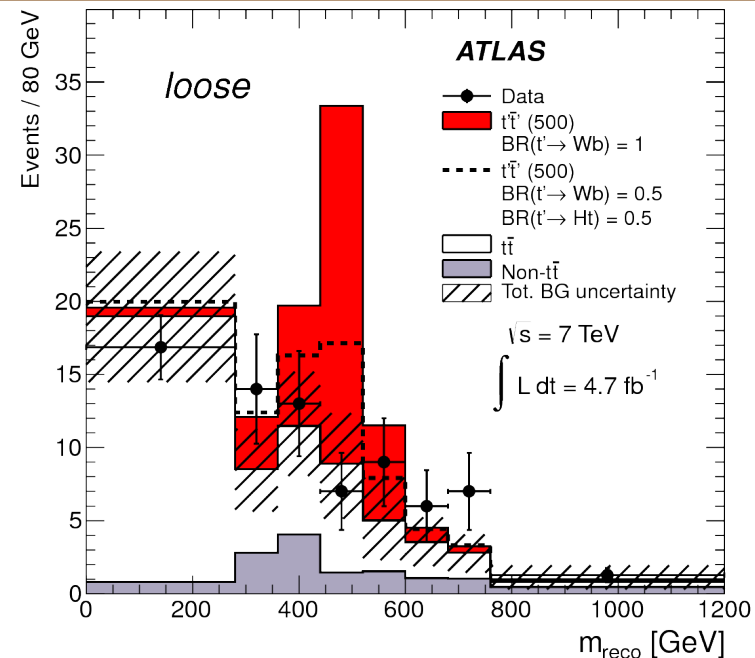

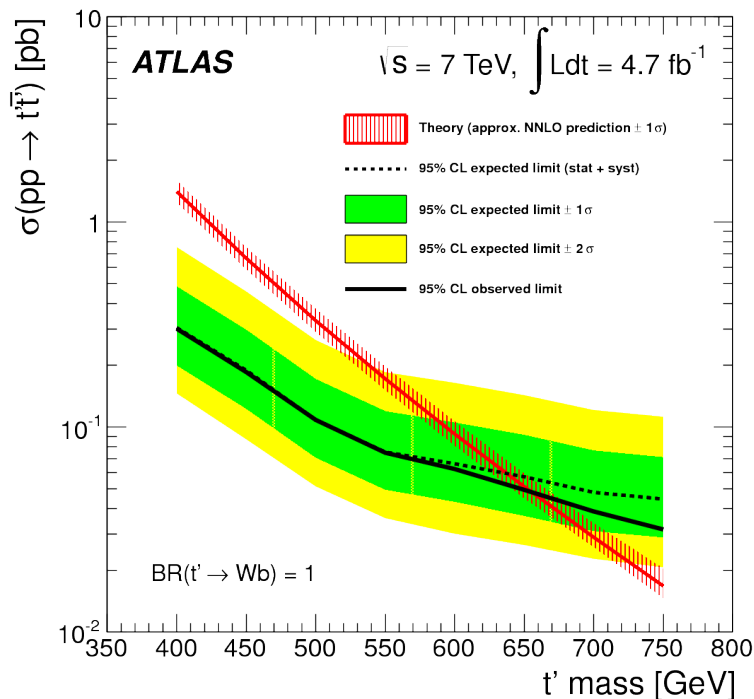

Z' Boson: tau channel

- Previous Z' search only looks in electron/muon channels
- If Z' decays predominantly to tau tau, dedicated search required
- Split by four tau decay channels:
 - Had-Had
 - Electron-Had
 - Muon-Had
 - Electron-Muon
- Additional MET, MT, and angular cuts to reject backgrounds

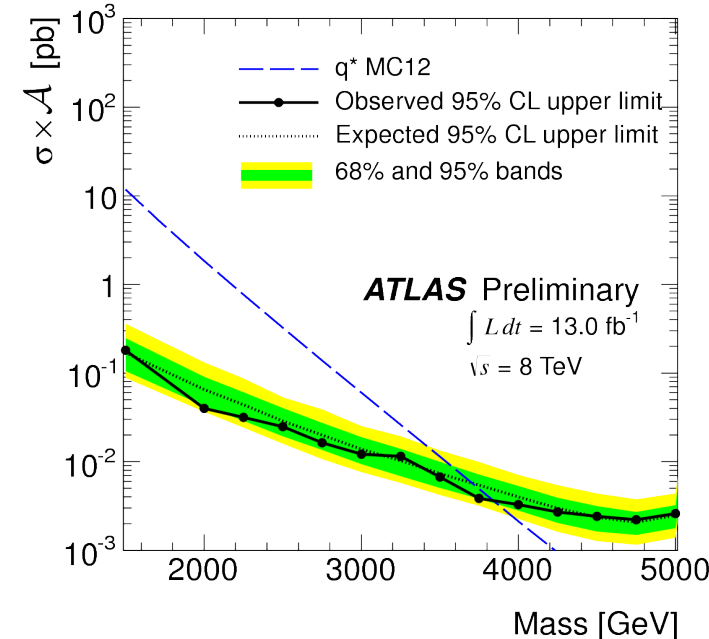

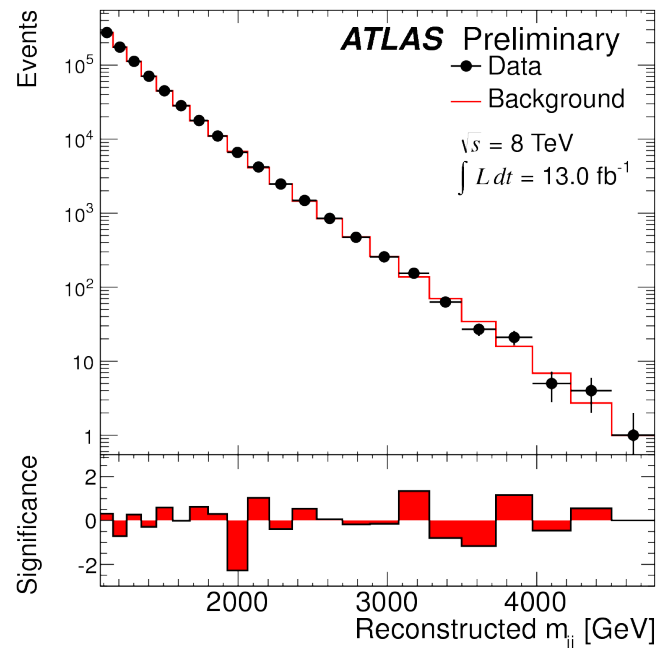

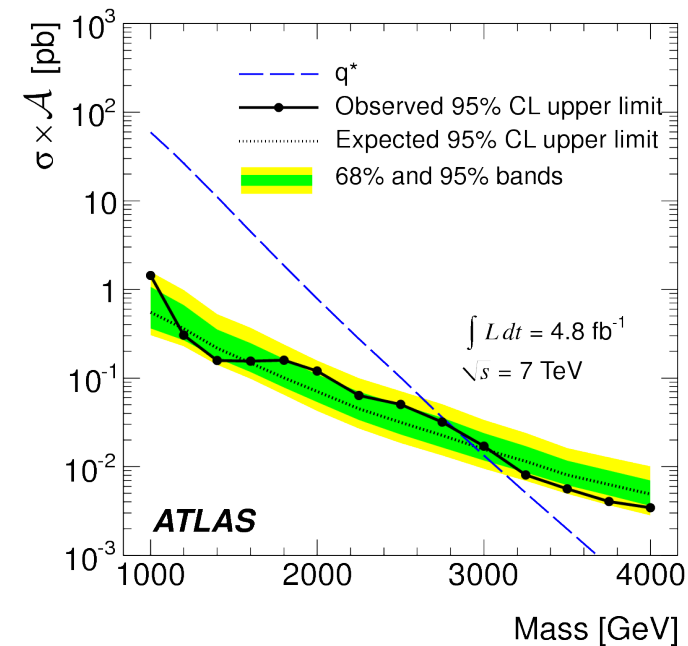

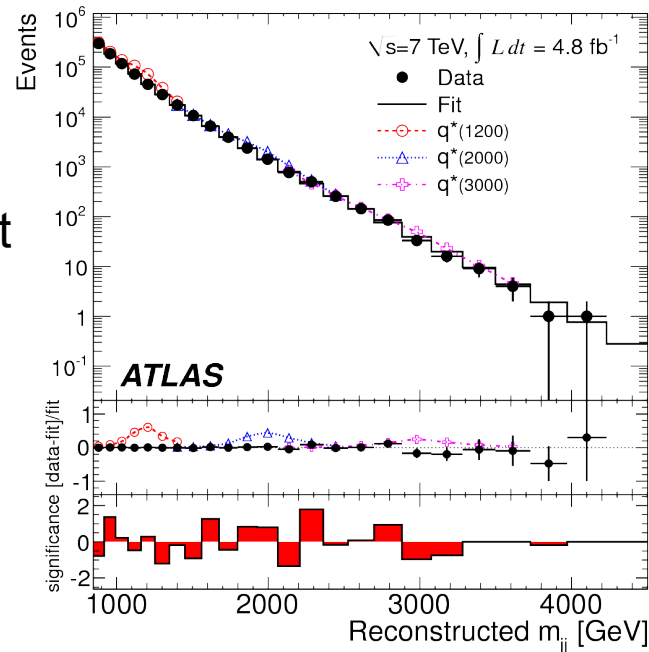

$t' \rightarrow Wb$: lepton+jets channel

- High mass 4th generation top quark like particle
- Search for $t't' \rightarrow Wb+Wb$ decay
 - Assumes t' mass is close to b' mass
- Look for events with boosted W
 - W may merge into one jet
- Selection
 - 2 jets + boosted jet, or 4+ jets
 - $H_T > 750$ GeV
 - 1 or two b-tagged jets
 - Tagged jets must have $\Delta R > 1.4$ between W candidates and leptons (tight requirement)

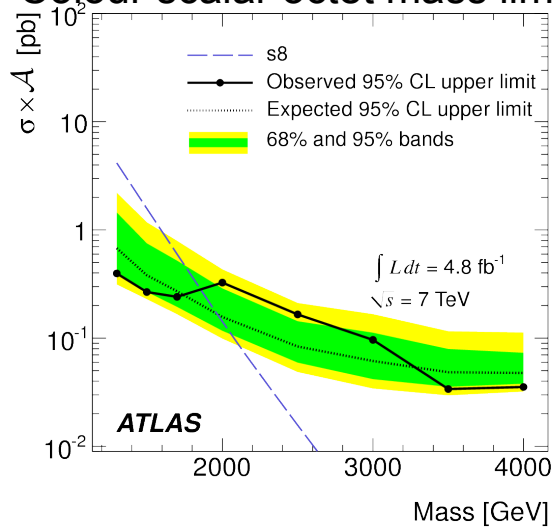

Dijet mass and angular distributions (1)

- 7 and 8 TeV analyses
- New physics can show up in the dijet invariant mass distribution or in the angular jet distributions
- Very inclusive type of search
 - Excited quarks
 - Colour octet scalars
 - Heavy W bosons
 - String resonances
 - Quantum black holes
 - Composite quarks
- Select events with two very high pT jets
- Compare shape of dijet distributions and angular variables
 - $X = \exp(|y_1 - y_2|)$

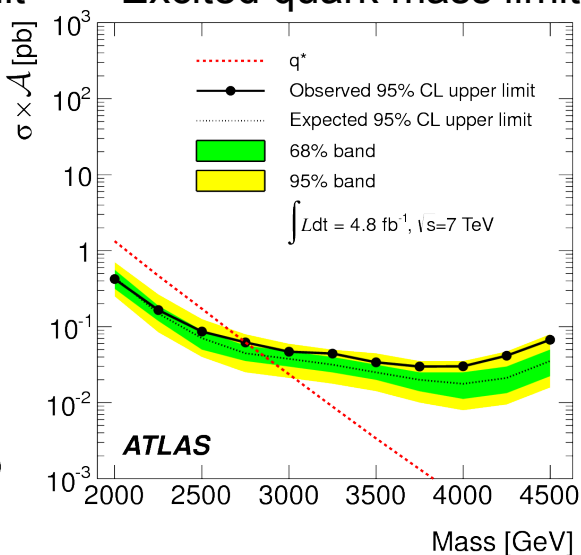

Dijet angular distributions (2)

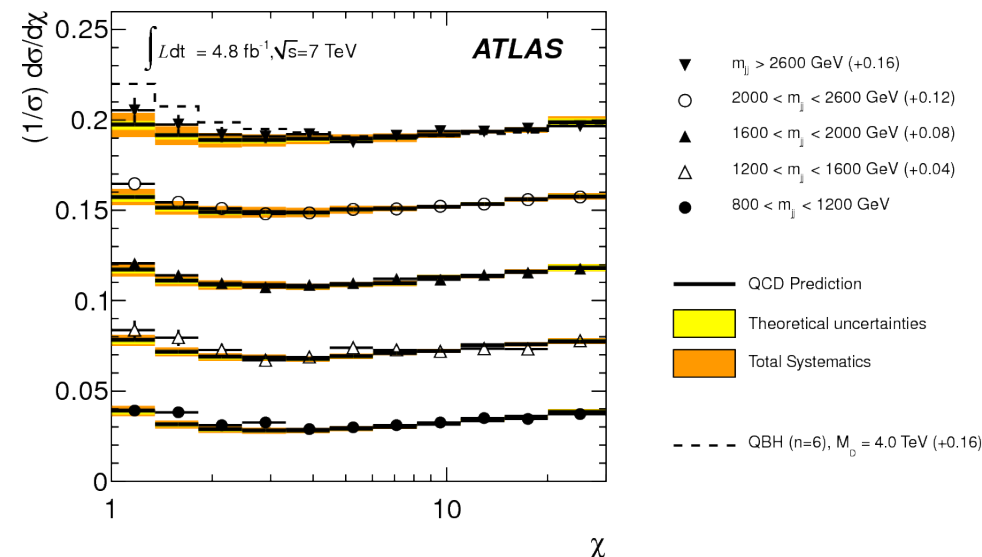

Colour scalar octet mass limit

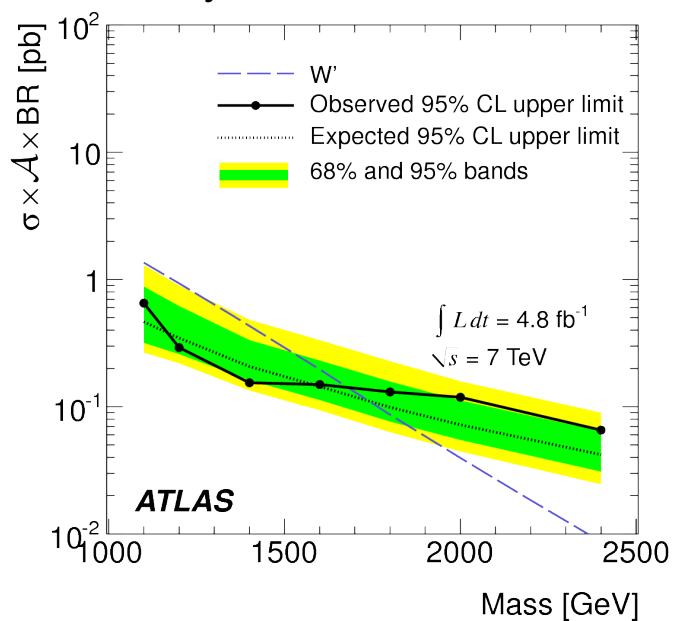

Excited quark mass limit

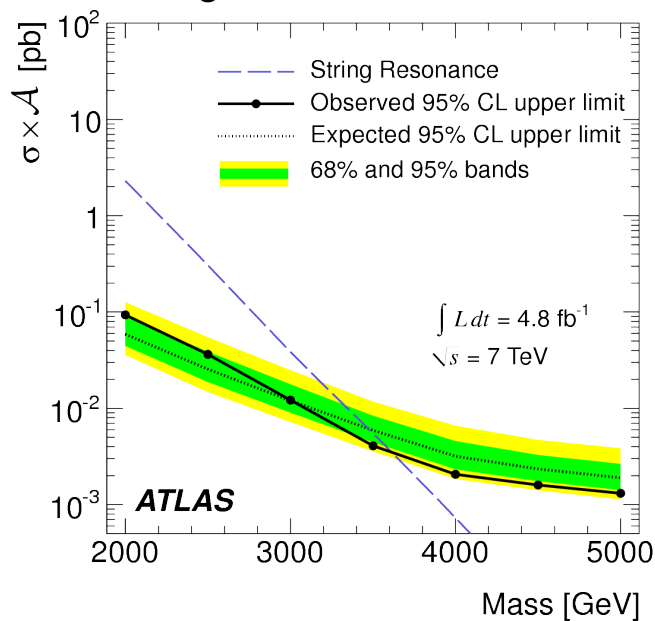

X distributions

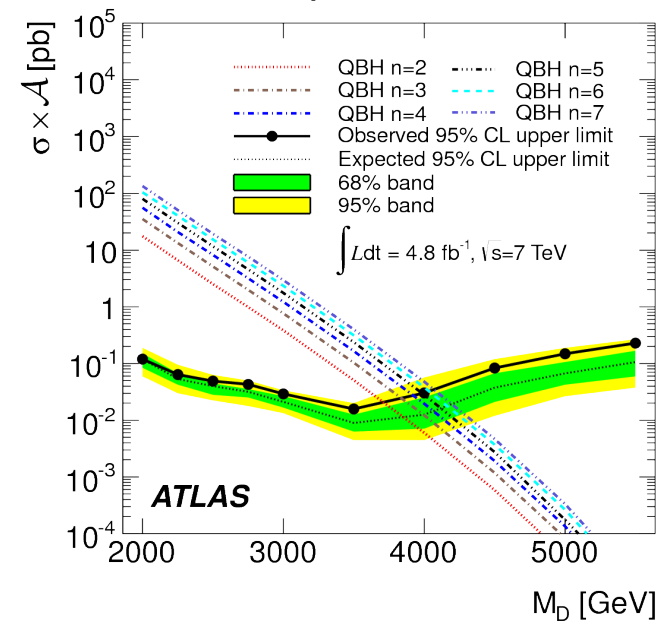

Heavy W' boson mass limit

String resonance mass limit

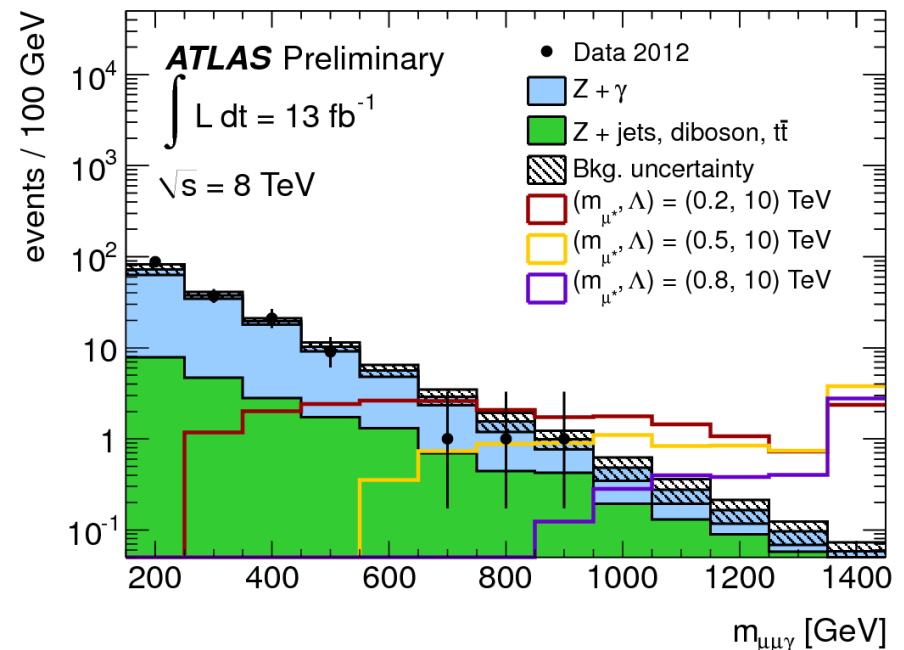

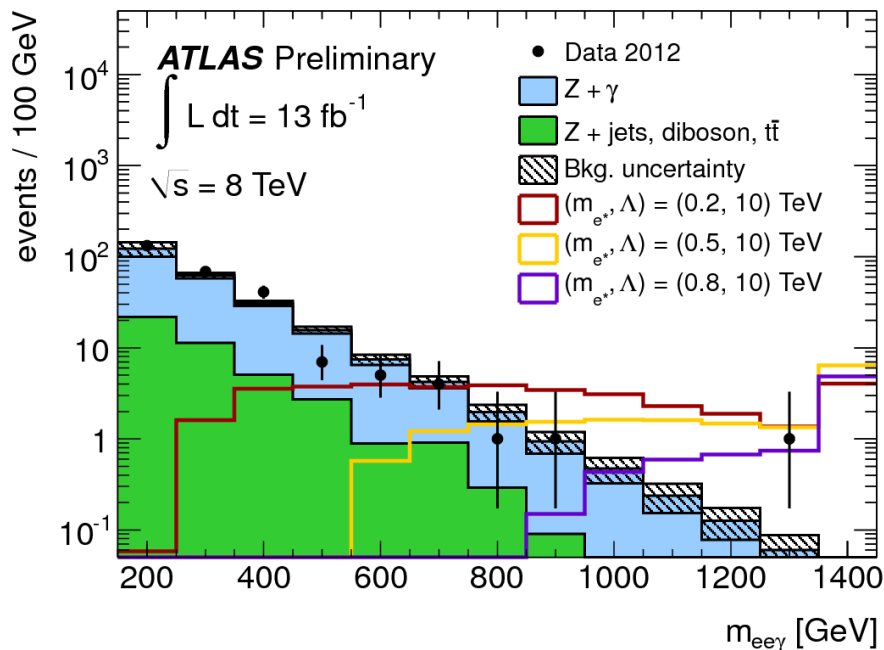

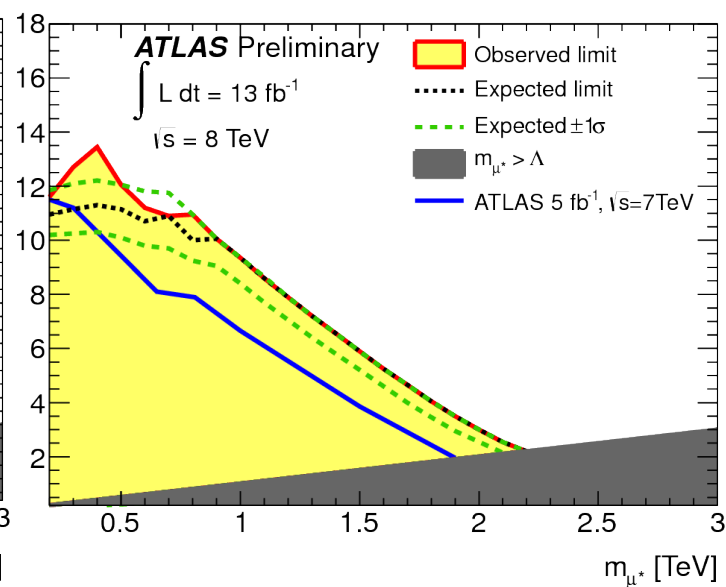

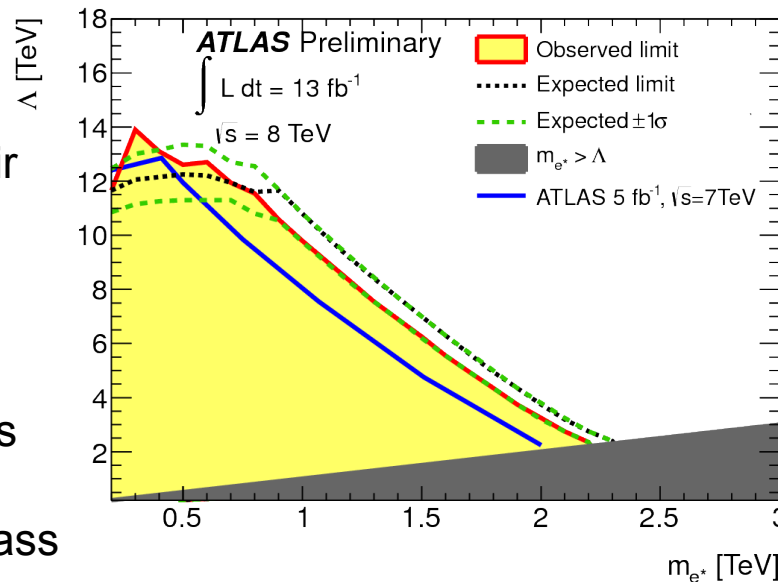

Reduced plank mass limit

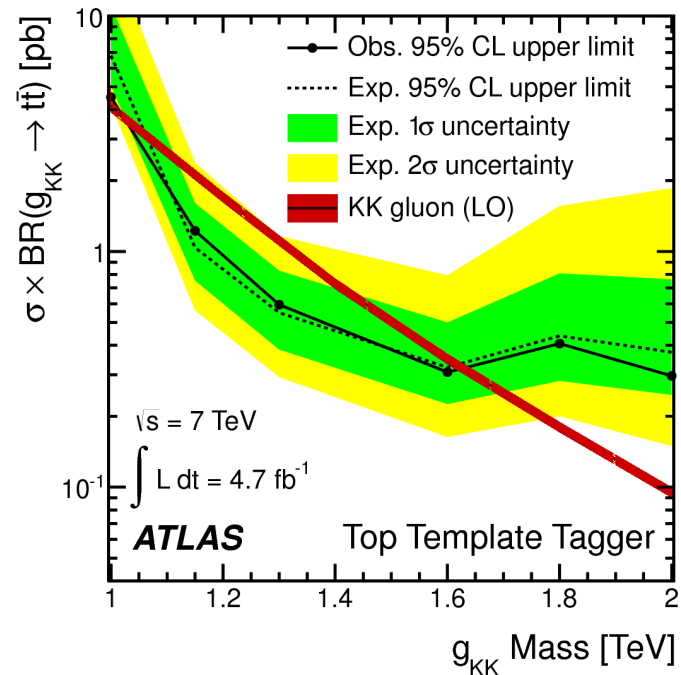

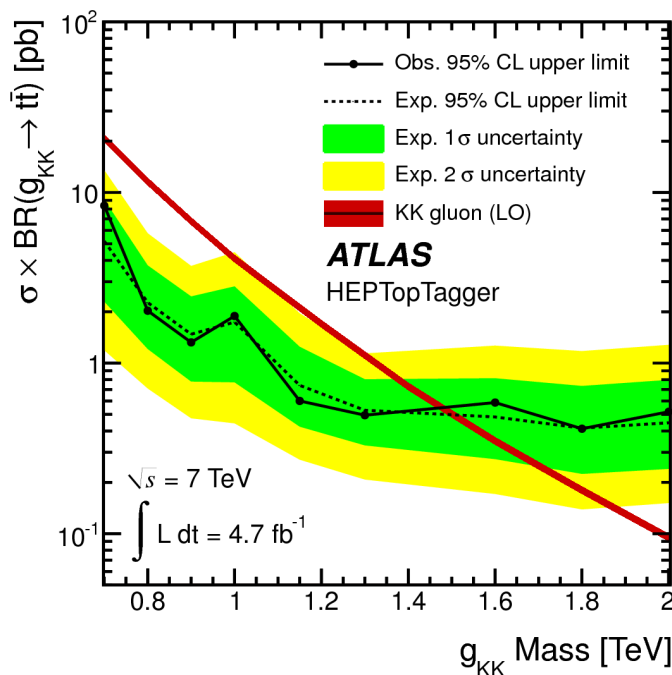

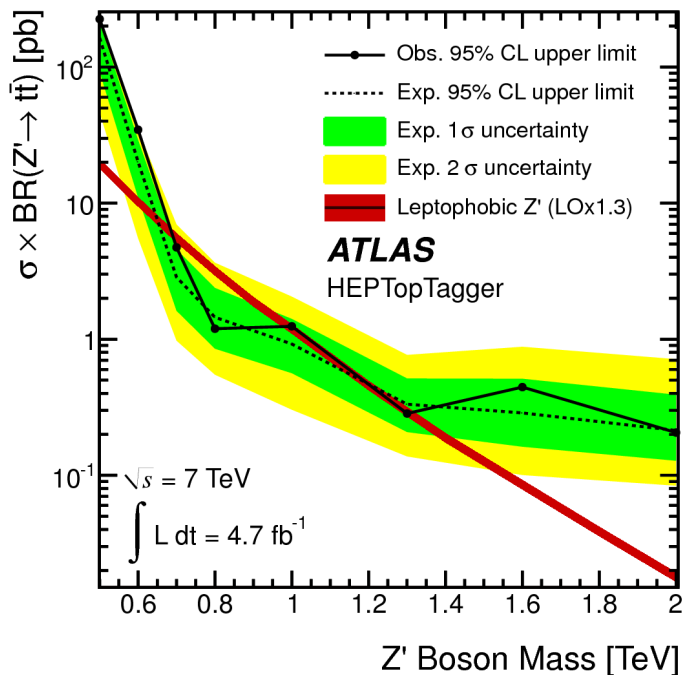

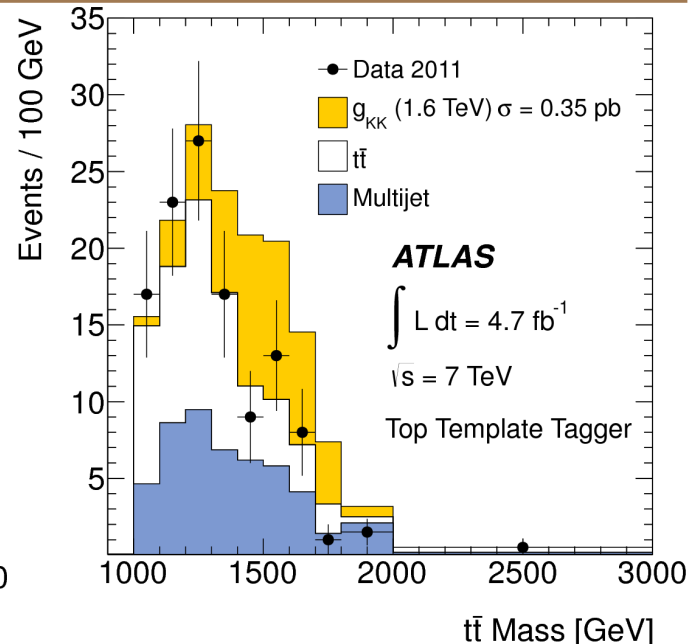

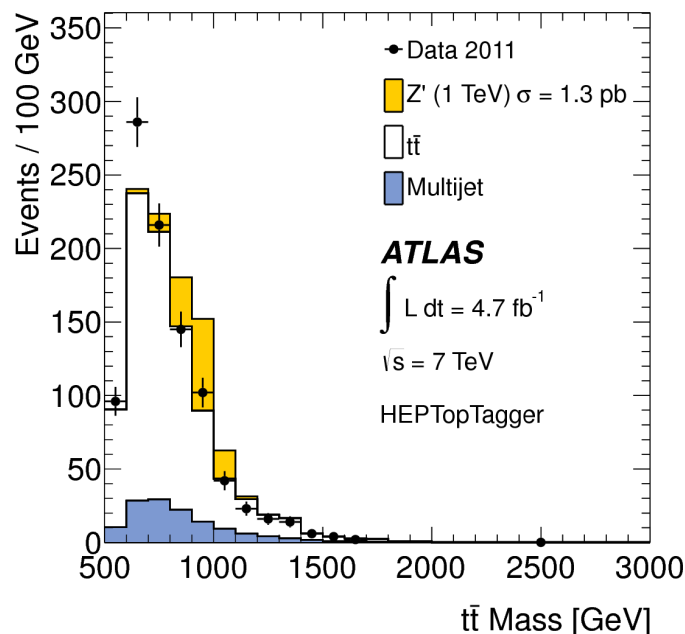

Excited leptons

- 8 TeV analysis
- Look for excited leptons decaying into a lepton pair plus photon
- Signature of composite leptons
- Look at invariant mass distribution of both leptons and photon
- Limit on excited lepton mass vs compositeness scale

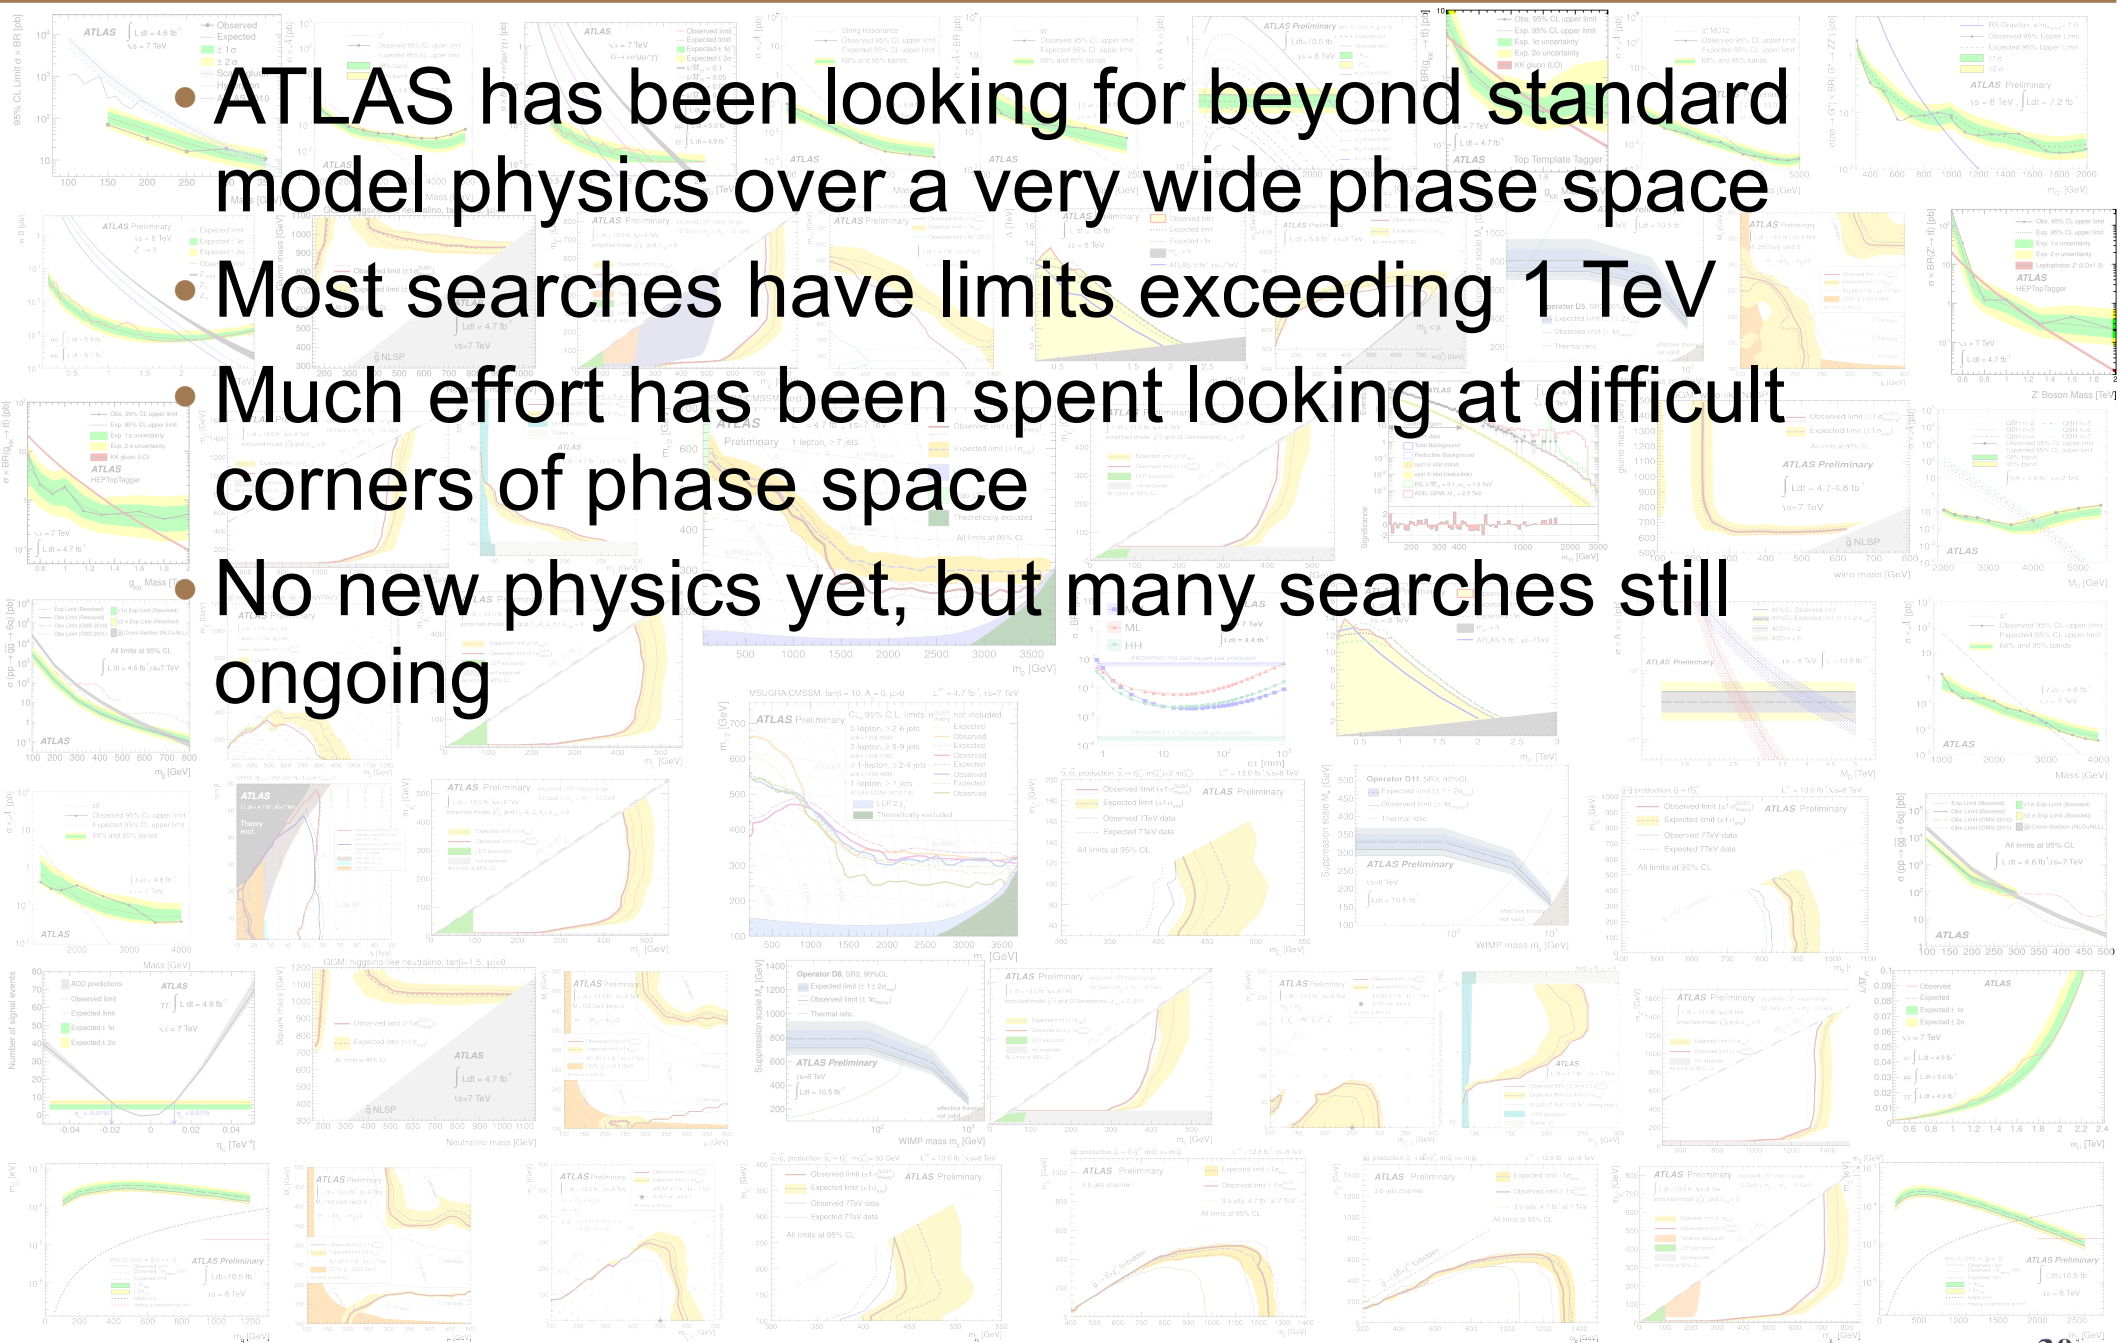

Top quark pair resonances

- Leptophobic Z' or KK gluons can decay into $t\bar{t}$ pairs
- Look for events with 2 high p_T jets and 2 b-tagged jets
- Use jet substructure information
 - HEPTopTagger
 - For top $p_T > 200$ GeV
 - $R=1.5$ jets
 - Top Template Tagger
 - For top $p_T > 450$ GeV
 - $R=1.0$ jets

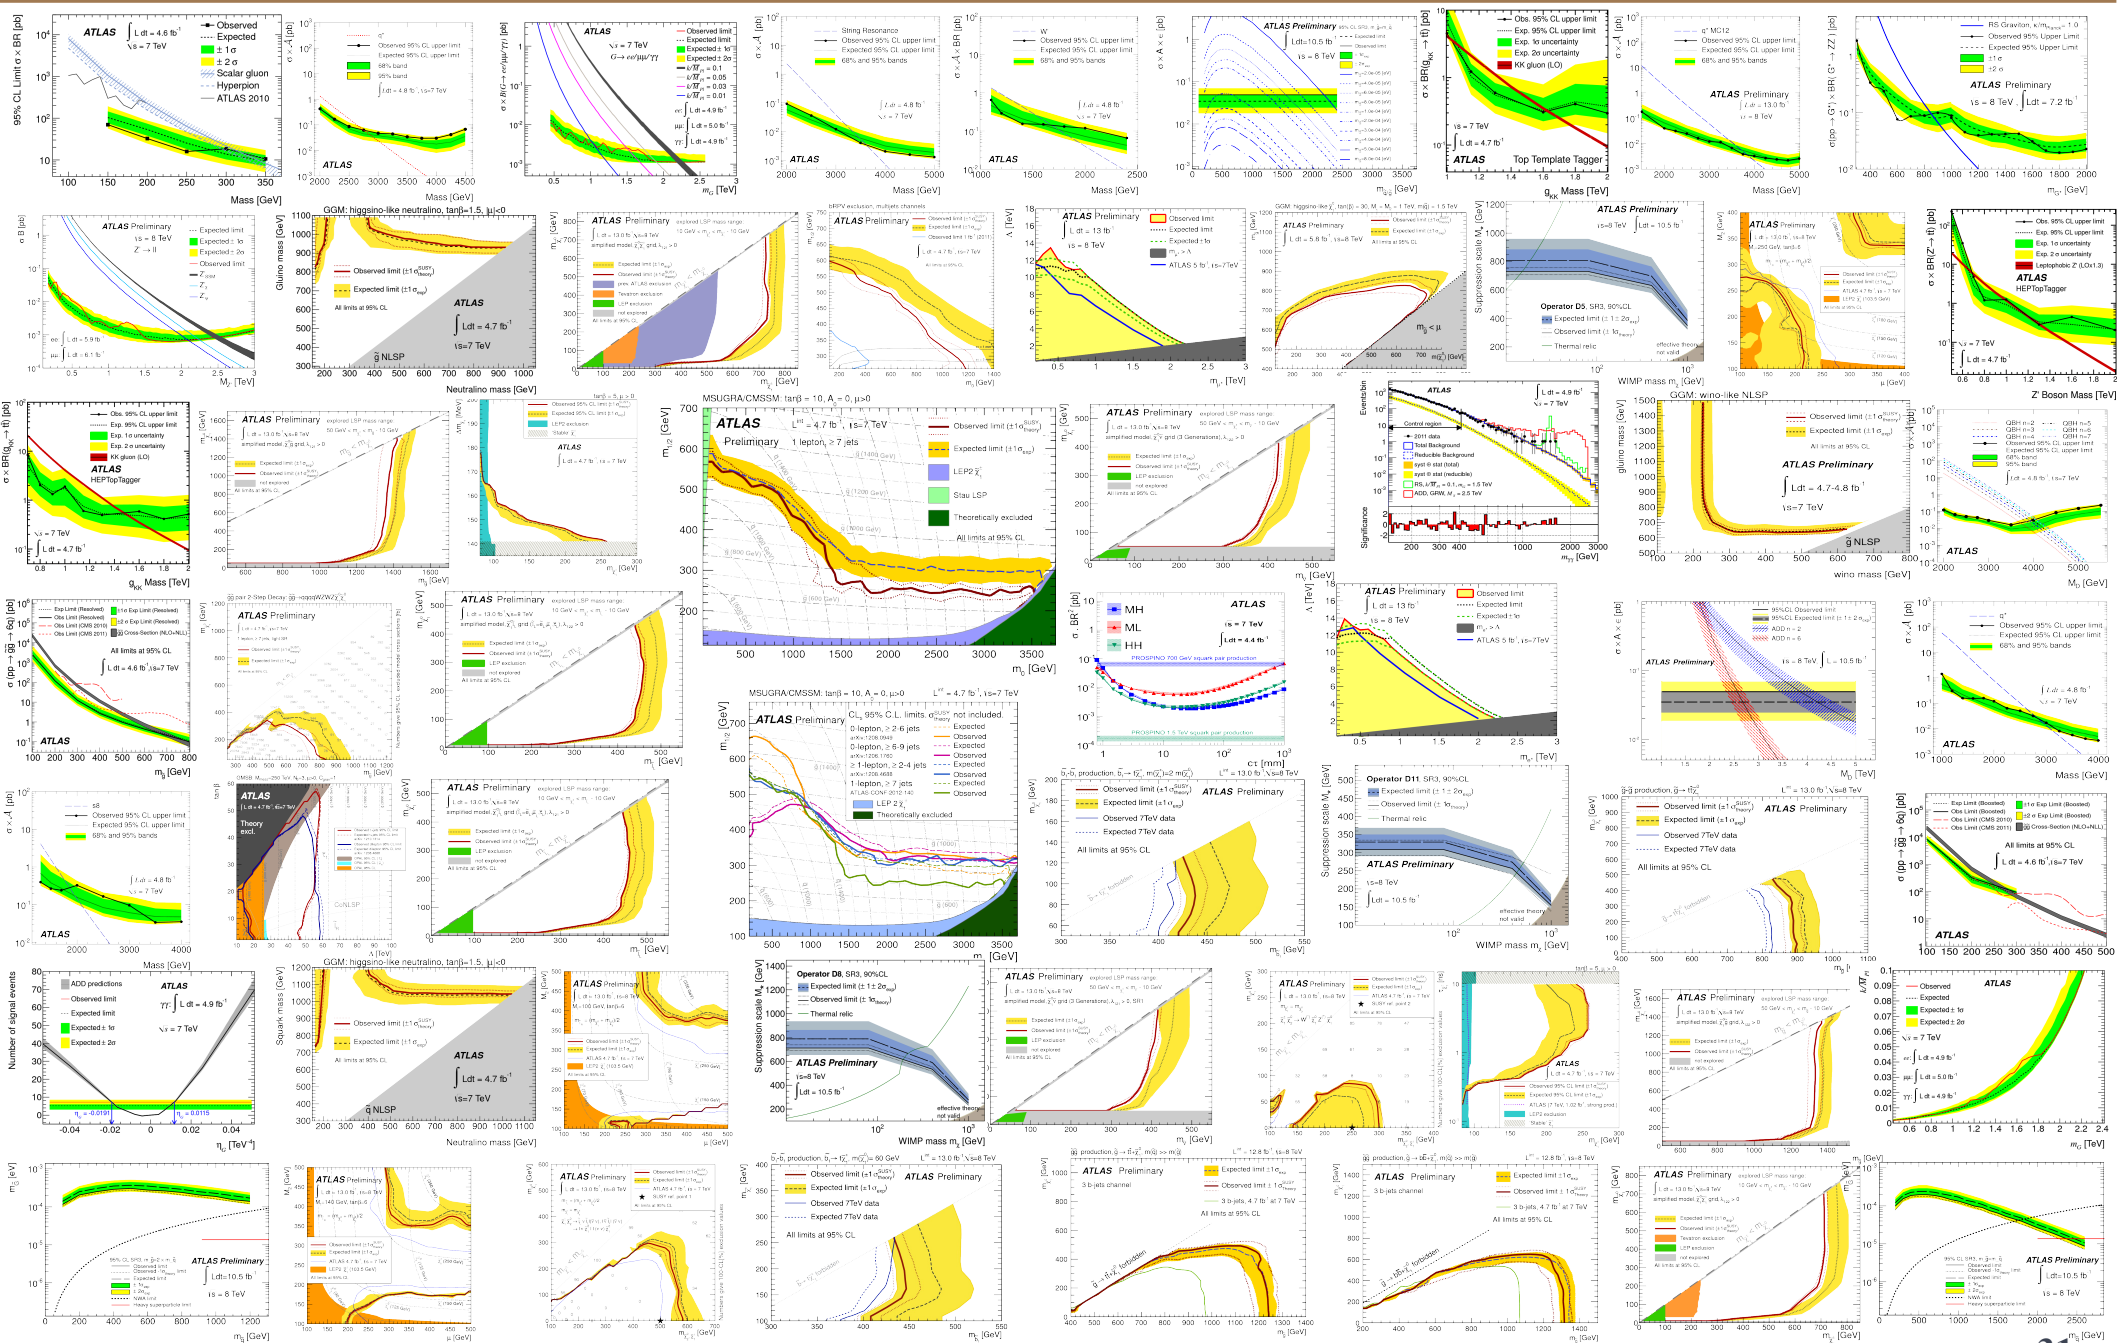

Summary

- ATLAS has been looking for beyond standard model physics over a very wide phase space
- Most searches have limits exceeding 1 TeV
- Much effort has been spent looking at difficult corners of phase space
- No new physics yet, but many searches still ongoing

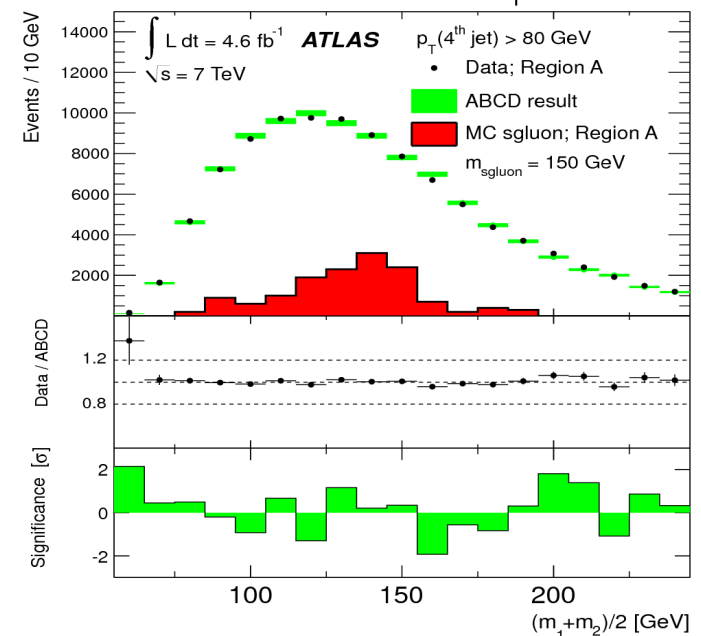

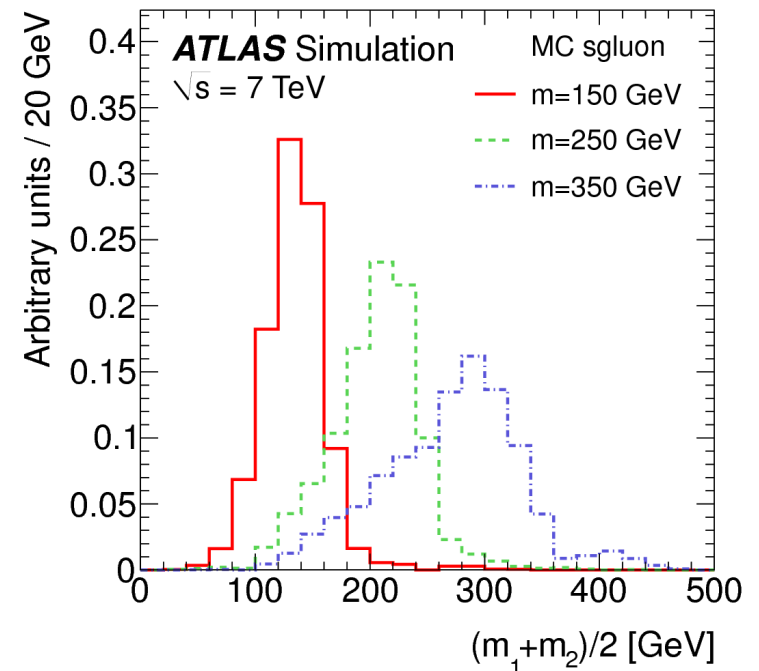

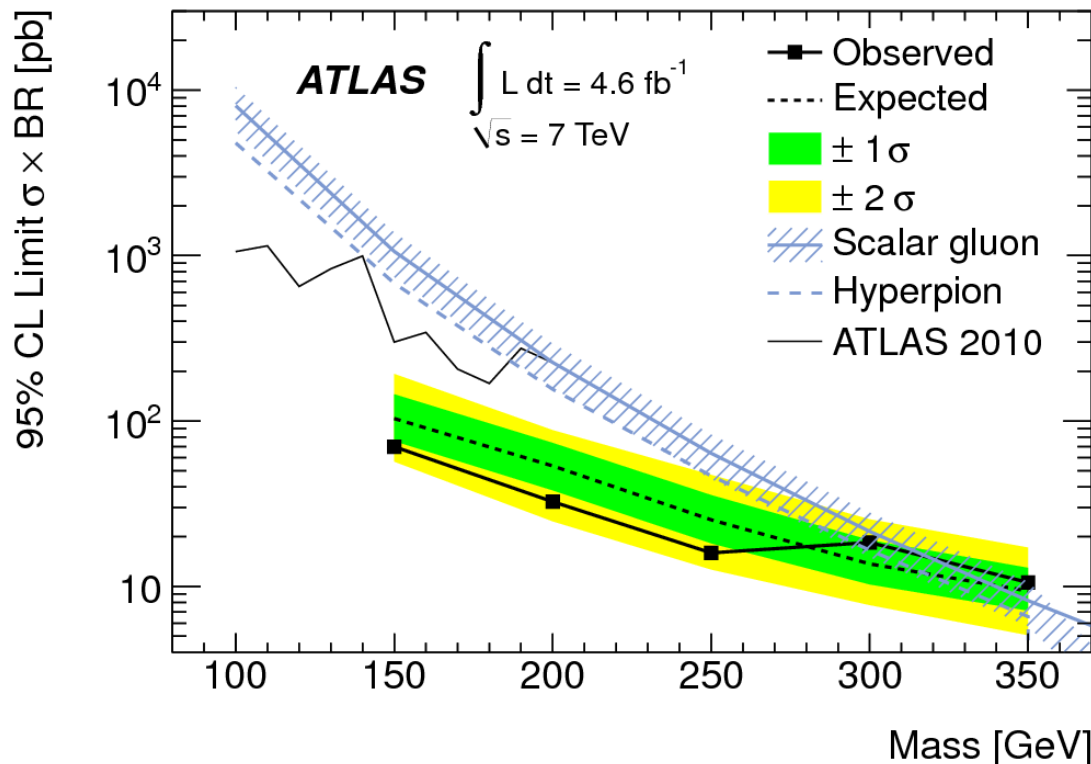

Thank you

Backup Slides

Scalar gluons: four jet channel

- Pair produced scalar gluons
 - Each decays into a pair of jets
- Reconstruct events with 4 jets into two pairs
 - Minimize $|\Delta R_{\text{pair1}} - 1| + |\Delta R_{\text{pair2}} - 1|$
 - Mass of each pair should be within 30% of each other
 - Require $|\cos(\text{scattering angle})| < 0.15$

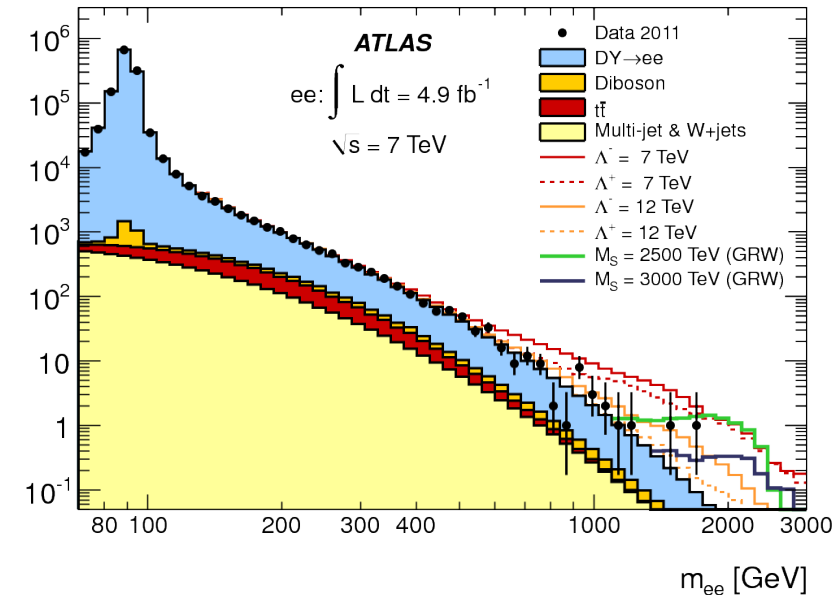

Extra Dimensions & Composite Particles: Dilepton channel

- New physics can change the dilepton invariant mass distribution
 - Gravitons/Extra dimensions
 - ADD model
 - Contact interactions
 - Composite quarks/leptons
- Select events with a pair of high p_T electrons or muons
 - Well reconstructed and isolated leptons
- Use binned likelihood to compare data to different models

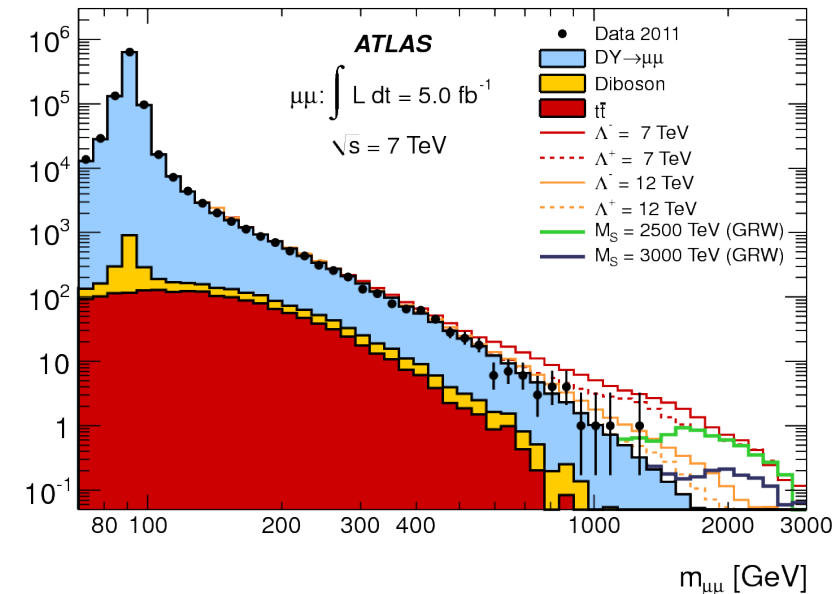

Events with $m_{ll} > 1.3$ TeV

| Process | ee | $\mu\mu$ |
|------------------|-------------------|-------------------|
| DY | 0.89 ± 0.21 | 0.54 ± 0.16 |
| $t\bar{t}$ | < 0.01 | < 0.01 |
| Diboson | 0.075 ± 0.005 | 0.059 ± 0.010 |
| Multi-jet/W+jets | 0.16 ± 0.20 | – |
| Total background | 1.13 ± 0.29 | 0.60 ± 0.16 |
| $M_S = 1.5$ TeV | 72 ± 5 | 47 ± 9 |
| $M_S = 2.0$ TeV | 40.2 ± 2.6 | 22 ± 4 |
| $M_S = 2.5$ TeV | 11.7 ± 0.9 | 6.3 ± 1.1 |
| $M_S = 3.0$ TeV | 4.2 ± 0.4 | 2.3 ± 0.4 |

Limits on contact
 interaction scale

Inclusive search: Same sign leptons

- Standard model same sign lepton production is rare
- Select events with two well identified, isolated leptons with the same sign
- Can be produced in many BSM models
 - Left-right symmetric
 - Higgs triplet
 - Little Higgs
 - 4th quark family
 - SUSY
 - Extra dimensions
- Main backgrounds:
 - Mis-identification
 - Photon conversion
 - Diboson production
 - Non-prompt leptons
- Form invariant mass
 - Look for resonance

| Mass range | 95% C.L. upper limit [fb] | | | | | |
|---------------|---------------------------|----------|-----------------------------|----------|-------------------------------|----------|
