MID SHELL

Coulex of $^{184,186,188}\text{Hg}$: Motivation

$$E^*_{\text{intruder}}(4\text{p}-6\text{h}) = 4(\varepsilon_{j\pi} - \varepsilon_{j'\pi}) - \Delta E_{\text{pair}}^{\pi\pi} + \Delta E_M^{\pi\nu} - \Delta E_Q^{\pi\nu}$$

K. Heyde et al, Nucl. Phys. A 466, 189 (1987)

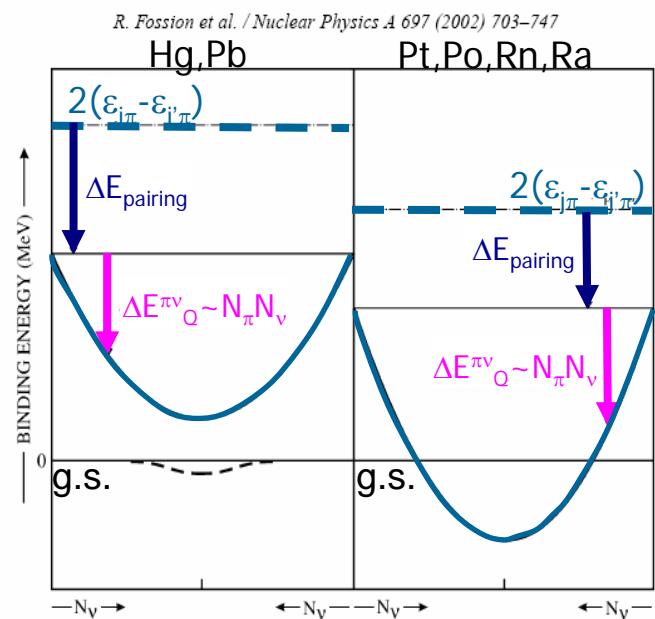

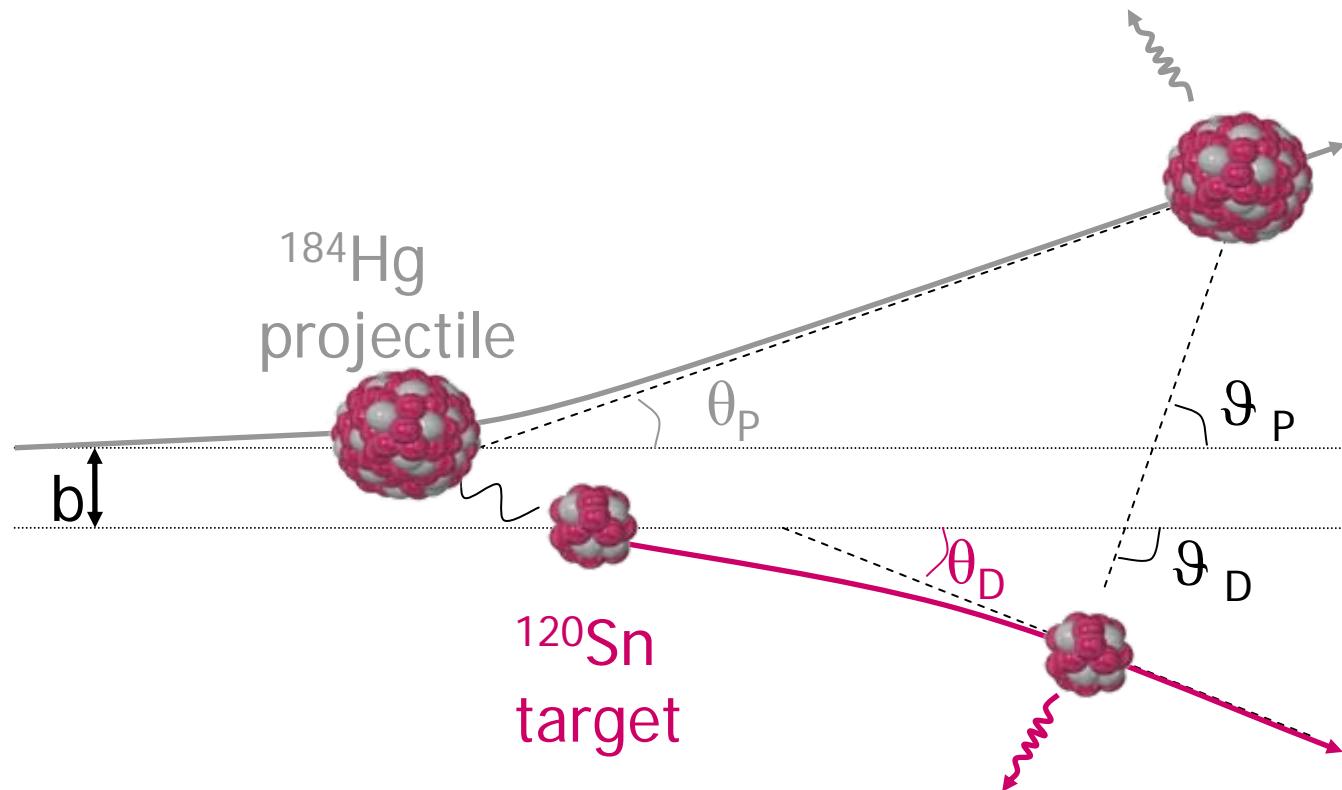

Fig. 13. Schematic representation of the effect of configuration mixing on the binding energy, plotting the different contributions separately. On the left, it is assumed that regular and intruder states seat far in energy. On the right, it is assumed that the regular and intruder states cross.

Slightly oblate ground state band
Prolate band

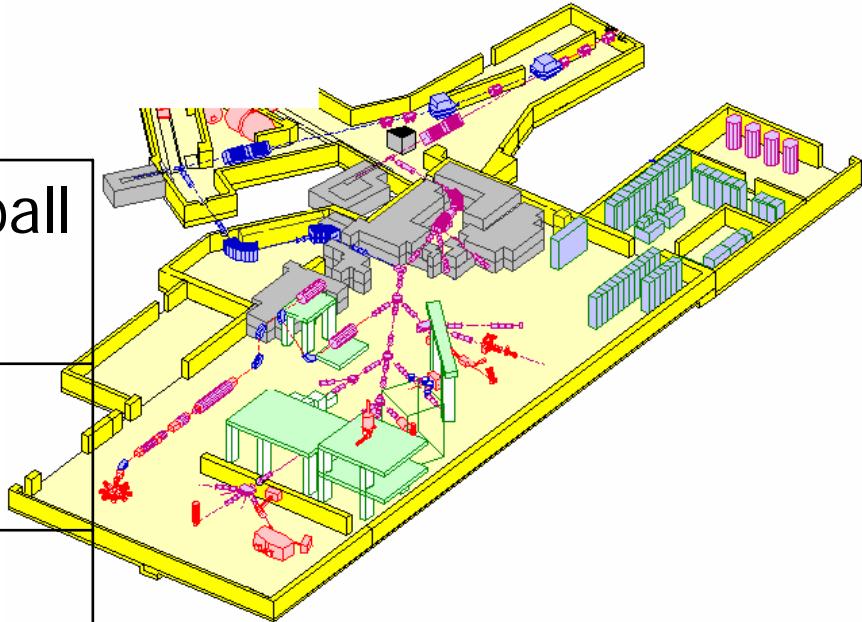

SHAPE COEXISTENCE

Coulex of $^{184,186,188}\text{Hg}$: Experimental set-up

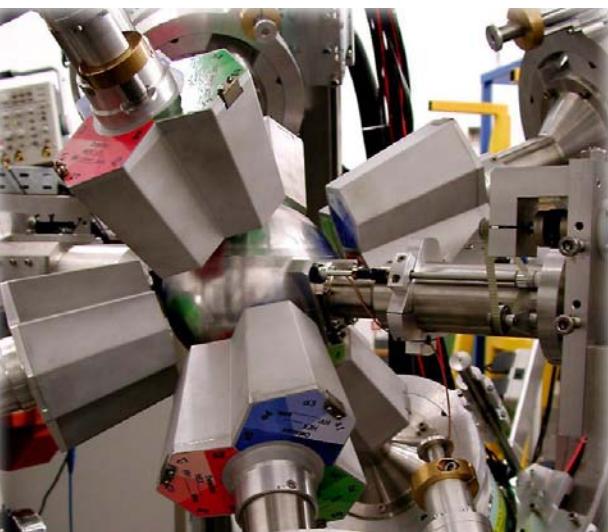

Coulex of $^{184,186,188}\text{Hg}$: Experimental set-up

Isotope	Charge state	Intensity@Miniball
^{184}Hg	43+	1.5×10^4 pps
^{186}Hg	43+	1.2×10^5 pps
^{188}Hg	44+	1.7×10^5 pps

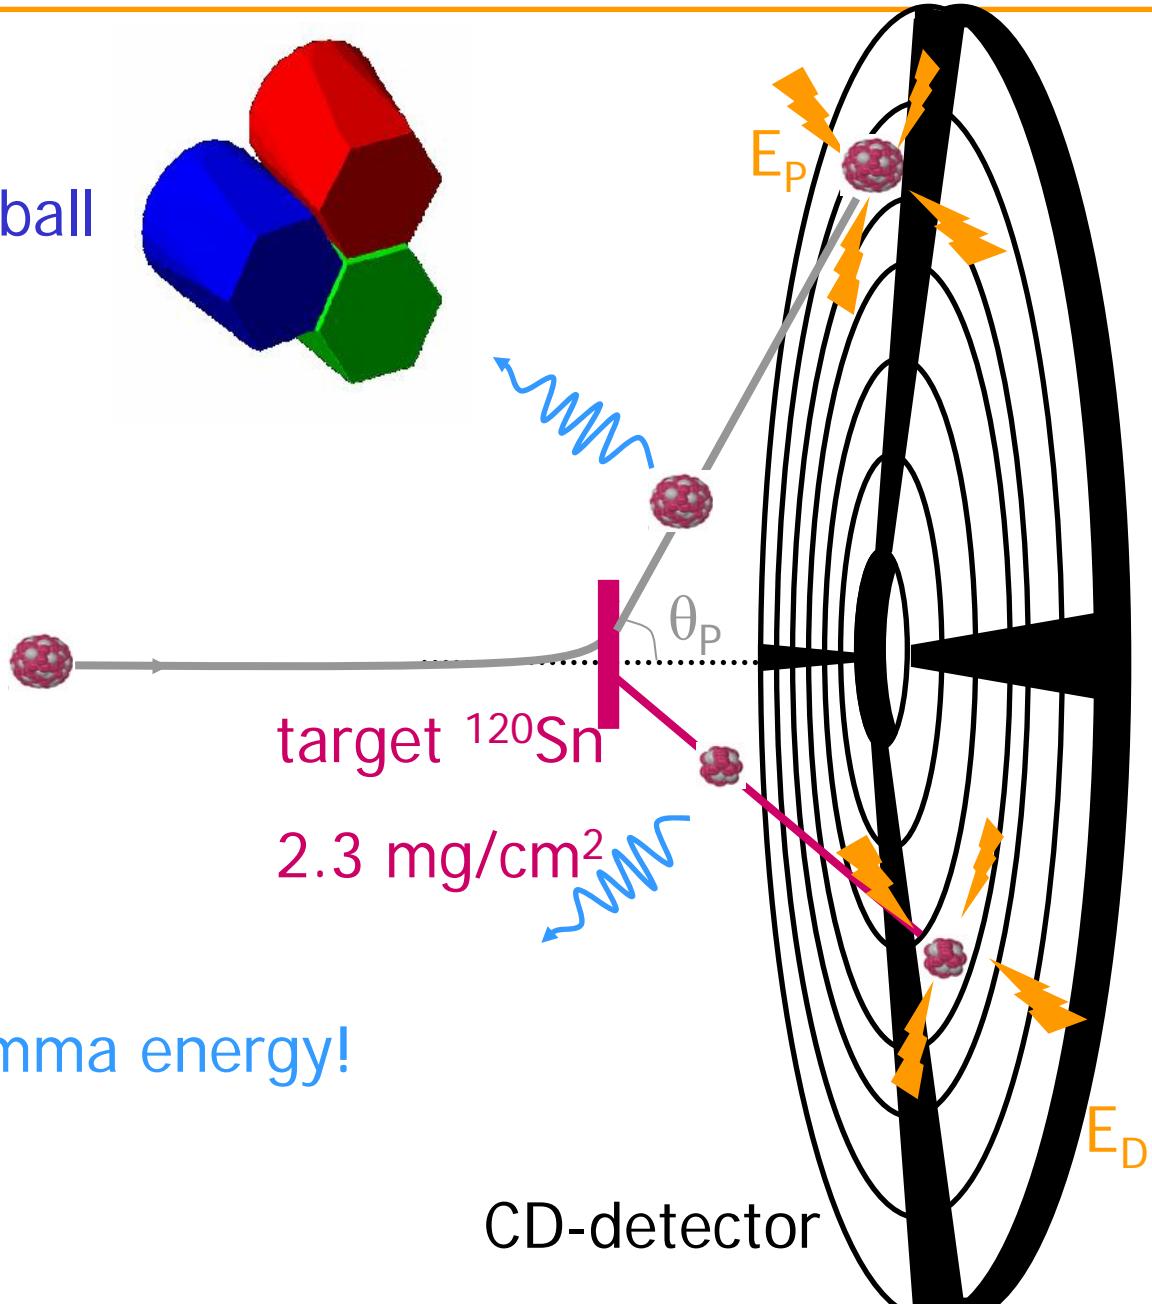

All 3 isotopes were post-accelerated by REX to 2.85 MeV/u.

Coulex of $^{184,186,188}\text{Hg}$: Preliminary experimental results

In August 2007 a Coulomb excitation was performed on the neutron deficient isotope ^{188}Hg .

Coulex of $^{184,186,188}\text{Hg}$: Conclusion and outlook

The detected γ yields of the photo peaks can be used to extract:

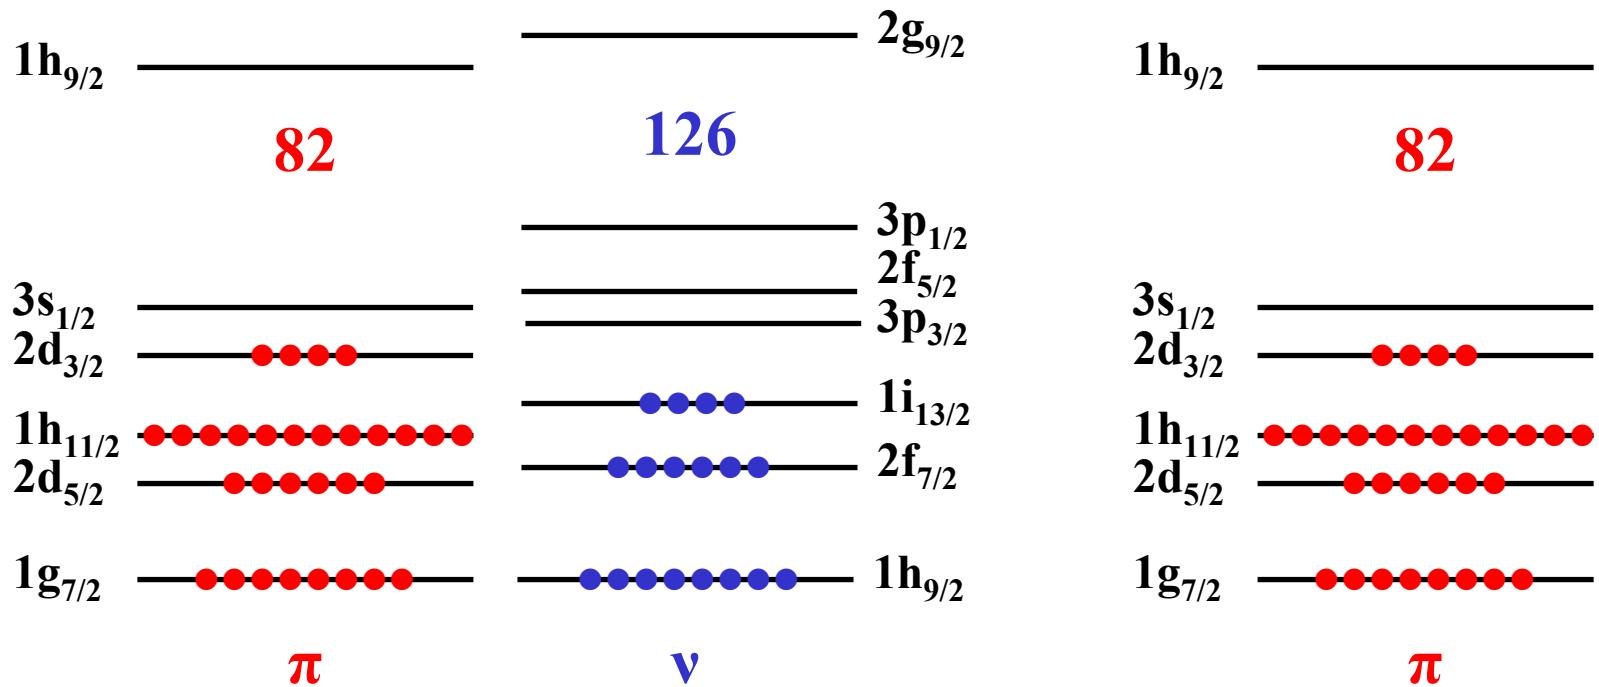

- transitional matrix elements ($B(E2)$ values)
- diagonal matrix elements (quadrupole moments)

This is done by the program GOSIA by fitting the matrix elements to produce the obtained γ yields by a χ^2 minimization. (T. Czosnyka et al, *GOSIA2*)

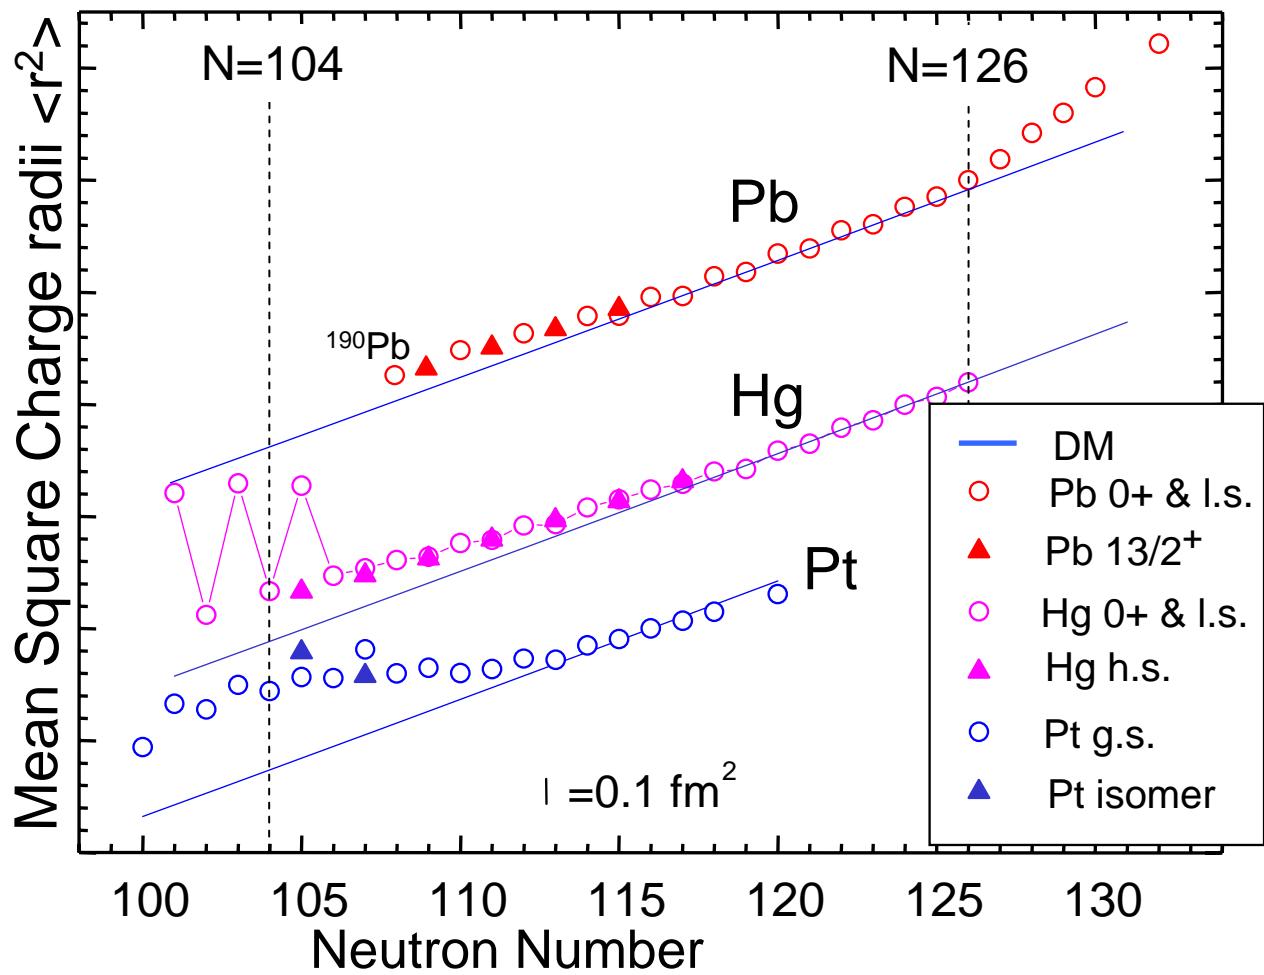

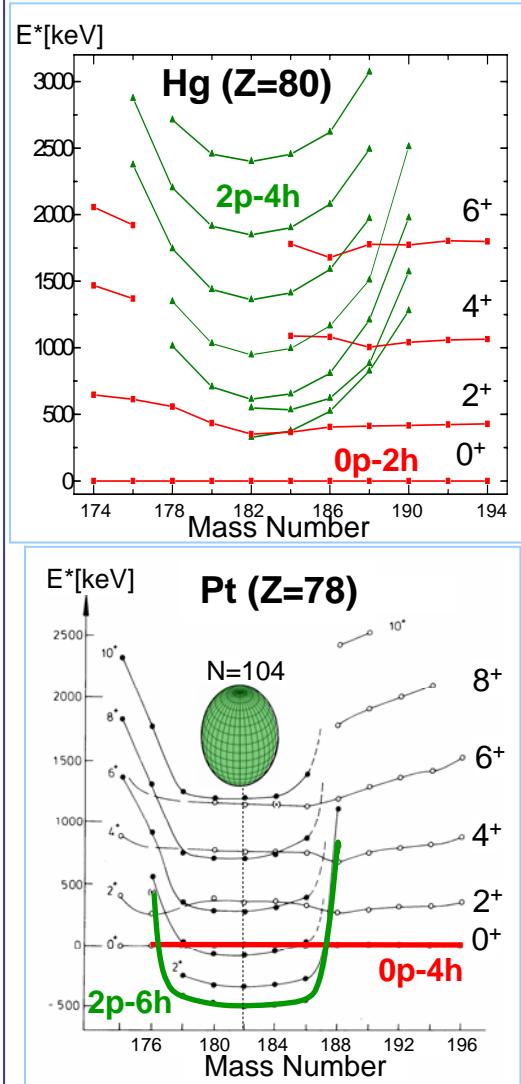

The evolution throughout the $^{184,186,188}\text{Hg}$ isotope chain will be investigated to enhance our understanding about the shape coexistence phenomenon in this mass region.

An addendum for a Coulex experiment on ^{182}Hg will be submitted.

Coulex of ^{68}Ni : Challenges and analysis improvements

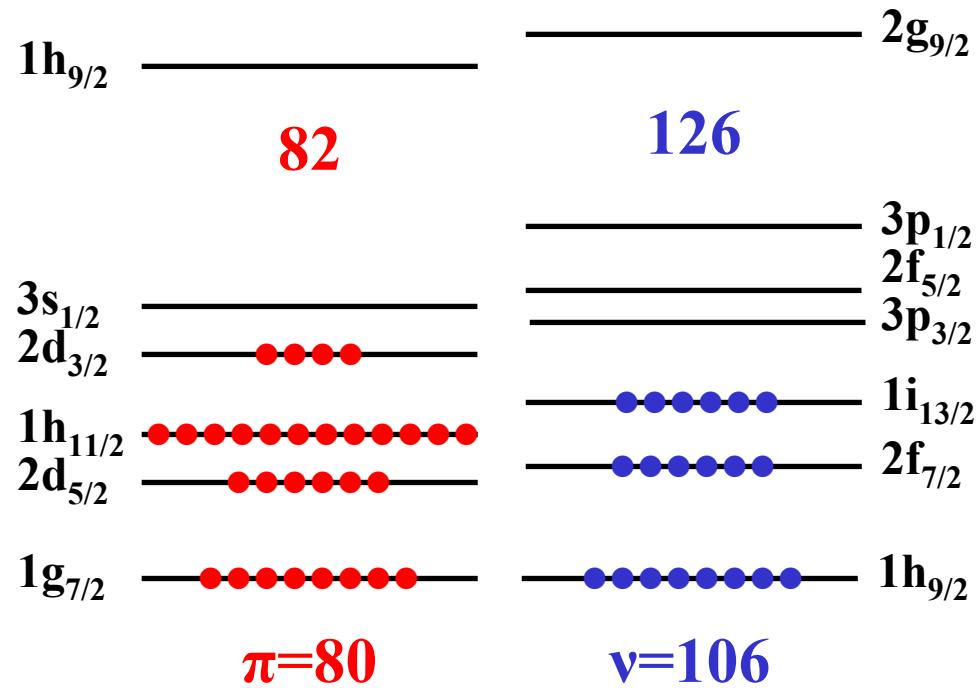

Coexistence and $\langle r^2 \rangle$ in the Lead

- Influence of intruder states on the $\langle r^2 \rangle$ values in Pt and Hg isotopes
- Evidence for a deviation of the $\langle r^2 \rangle$ values from the DM in Pb's around $^{190-194}\text{Pb}$
