## Structure of LHC Events

- 1. Hard process
- 2. Parton shower
- 3. Hadronization
- 4. Underlying event
- 5. Unstable particle decays

Mike Seymour

## Intro to Monte Carlo Event Generators

- 1. Parton showers
- 2. Hadronization
- 3. Underlying Event / Soft Inclusive Models

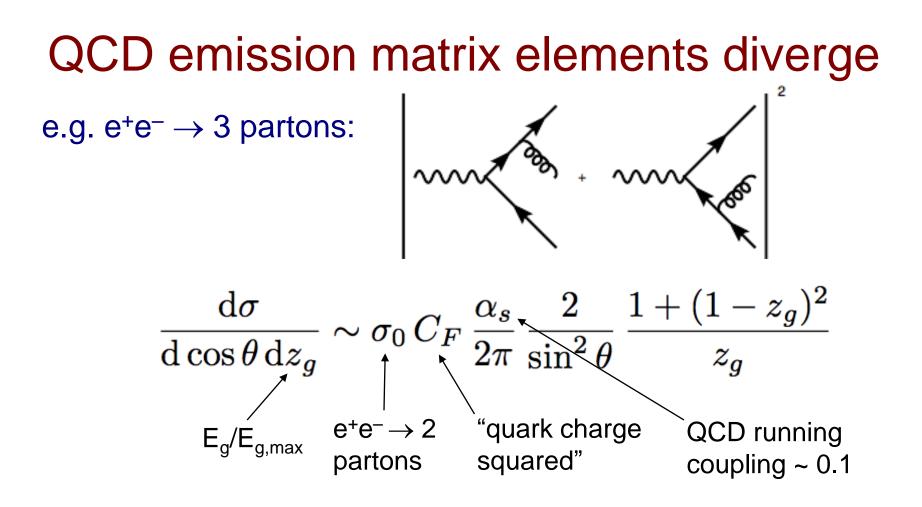

## Parton Showers: Introduction

- QED: accelerated charges radiate.
- QCD identical: accelerated colours radiate.
- gluons also charged.
- $\rightarrow$  cascade of partons.
- = parton shower.

- 1.  $e^+e^-$ annihilation to jets.
- 2. Universality of collinear emission.
- 3. Sudakov form factors.
- 4. Universality of soft emission.
- 5. Angular ordering.
- 6. Initial-state radiation.
- 7. Hard scattering.
- 8. Heavy quarks.
- 9. Dipole cascades.

Divergent in collinear limit  $\theta \rightarrow 0,\pi$  (for massless quarks) and soft limit  $z_g \rightarrow 0$ 

**Event Generators 1** 

can separate into two independent jets:

$2 d\cos\theta$	_	$d\cos heta$	$d\cos\theta$
$\sin^2\theta$	_	$\frac{1-\cos\theta}{1-\cos\theta}$	$\frac{1}{1+\cos\theta}$
		$d\cos\theta$ _	$d\cosar{ heta}$
		$\frac{1-\cos\theta}{1-\cos\theta}$	$\overline{1-\cosar{ heta}}$
	$\approx$	$\frac{d\theta^2}{\theta^2} + \frac{d\bar{\theta}^2}{\bar{\theta}^2}$	

jets evolve independently

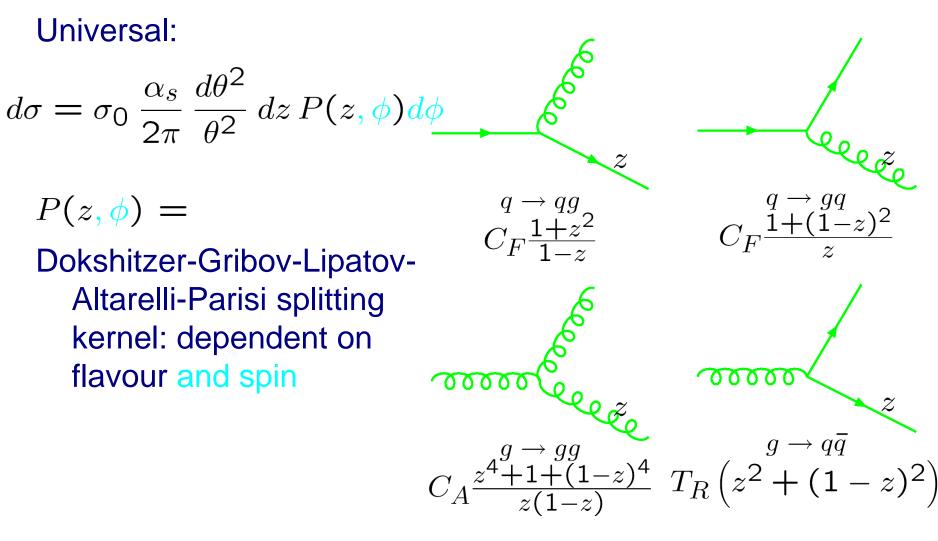

$$d\sigma = \sigma_0 \sum_{\text{jets}} C_F \frac{\alpha_s}{2\pi} \frac{d\theta^2}{\theta^2} dz \frac{1 + (1 - z)^2}{z}$$

Exactly same form for anything  $\propto \theta^2$ eg transverse momentum:  $k_{\perp}^2 = z^2(1-z)^2 \ \theta^2 \ E^2$ invariant mass:  $q^2 = z(1-z) \ \theta^2 \ E^2$ 

$$\frac{d\theta^{2}}{\theta^{2}} = \frac{dk_{\perp}^{2}}{k_{\perp}^{2}} = \frac{dq^{2}}{k_{\perp}^{2}}$$

$$\frac{dq^{2}}{\frac{dq^$$

### **Collinear Limit**

**Event Generators 1** 

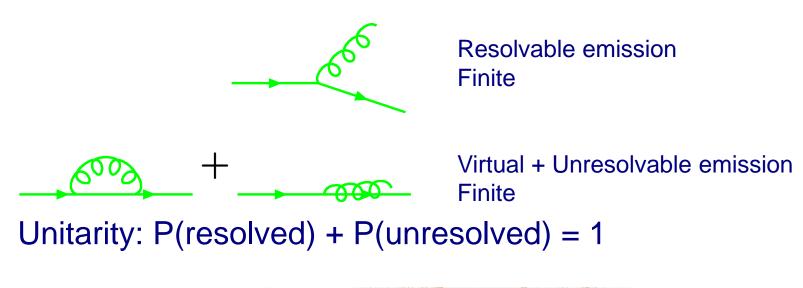

#### **Resolvable partons**

What is a parton? Collinear parton pair  $\longleftrightarrow$  single parton

Introduce resolution criterion, eg  $k_{\perp} > Q_0$ .

Virtual corrections must be combined with unresolvable real emission

Mike Seymour

#### Sudakov form factor

Probability(emission between  $q^2$  and  $q^2 + dq^2$ )  $d\mathcal{P} = \frac{\alpha_s}{2\pi} \frac{dq^2}{q^2} \int_{Q_0^2/q^2}^{1-Q_0^2/q^2} dz \ P(z) \equiv \frac{dq^2}{q^2} \bar{P}(q^2).$ 

Define probability(no emission between  $Q^2$  and  $q^2$ ) to be  $\Delta(Q^2, q^2)$ . Gives evolution equation

$$\frac{d\Delta(Q^2, q^2)}{dq^2} = \Delta(Q^2, q^2) \frac{d\mathcal{P}}{dq^2}$$
$$\Rightarrow \Delta(Q^2, q^2) = \exp - \int_{q^2}^{Q^2} \frac{dk^2}{k^2} \bar{P}(k^2).$$

c.f. radioactive decay atom has probability  $\lambda$  per unit time to decay. Probability(no decay after time T) =  $\exp - \int^T dt \lambda$ 

**Event Generators 1** 

#### Sudakov form factor

Probability(emission between  $q^2$  and  $q^2 + dq^2$ )  $d\mathcal{P} = \frac{\alpha_s}{2\pi} \frac{dq^2}{q^2} \int_{Q_0^2/q^2}^{1-Q_0^2/q^2} dz \ P(z) \equiv \frac{dq^2}{q^2} \bar{P}(q^2).$ 

Define probability(no emission between  $Q^2$  and  $q^2$ ) to be  $\Delta(Q^2, q^2)$ . Gives evolution equation

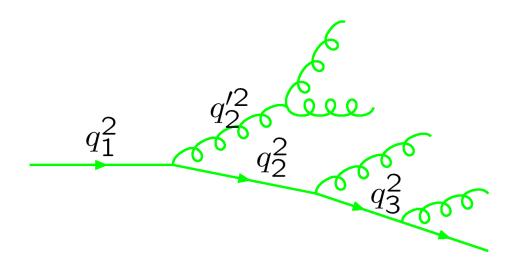

$$\frac{d\Delta(Q^2, q^2)}{dq^2} = \Delta(Q^2, q^2) \frac{d\mathcal{P}}{dq^2}$$
$$\Rightarrow \Delta(Q^2, q^2) = \exp - \int_{q^2}^{Q^2} \frac{dk^2}{k^2} \bar{P}(k^2).$$

 $\Delta(Q^2, Q_0^2) \equiv \Delta(Q^2)$  Sudakov form factor =Probability(emitting no resolvable radiation)

 $\Delta_q(Q^2) \sim \exp_{Carlo} \frac{\alpha_s}{2\pi} \log^2 \frac{Q^2}{Q^2}$ MCnet

Mike Seymour

#### **Multiple emission**

#### But initial condition? $q_1^2 < ???$

Process dependent

**Event Generators 1** 

## Monte Carlo implementation

Can generate branching according to

$$d\mathcal{P} = \frac{dq^2}{q^2} \bar{P}(q^2) \,\Delta(Q^2, q^2)$$

By choosing  $0 < \rho < 1$  uniformly: If  $\rho < \Delta(Q^2)$  no resolvable radiation, evolution stops. Otherwise, solve  $\rho = \Delta(Q^2, q^2)$ for  $q^2$ =emission scale

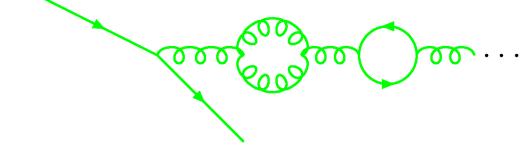

Considerable freedom: Evolution scale:  $q^2/k_{\perp}^2/\theta^2$  ? z: Energy? Light-cone momentum? Massless partons become massive. How? Upper limit for  $q^2$ ?

All formally free choices, but can be very important numerically

Mike Seymour

## Running coupling

Effect of summing up higher orders:

absorbed by replacing  $\alpha_s$  by  $\alpha_s(k_{\perp}^2)$ .

Much faster parton multiplication – phase space fills with soft gluons.

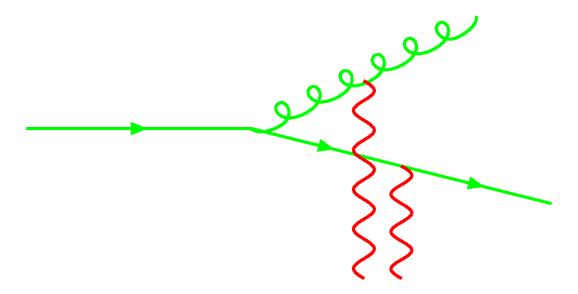

Must then avoid Landau pole:  $k_{\perp}^2 \gg \Lambda^2$ .  $Q_0$  now becomes physical parameter!

**Event Generators 1** 

## Soft limit

Also universal. But at amplitude level...

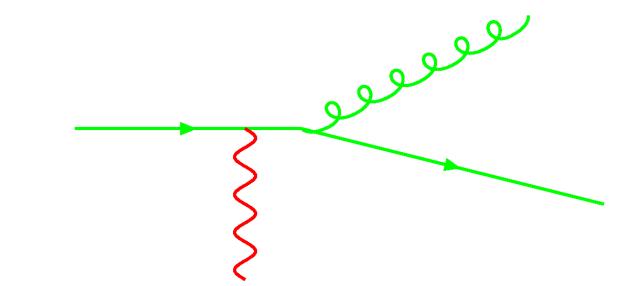

soft gluon comes from everywhere in event. → Quantum interference. Spoils independent evolution picture?

**Event Generators 1** 

## Angular ordering

outside angular ordered cones, soft gluons sum coherently: only see colour charge of whole jet.

Soft gluon effects fully incorporated by using  $\theta^2$  as evolution variable: angular ordering

First gluon not necessarily hardest!

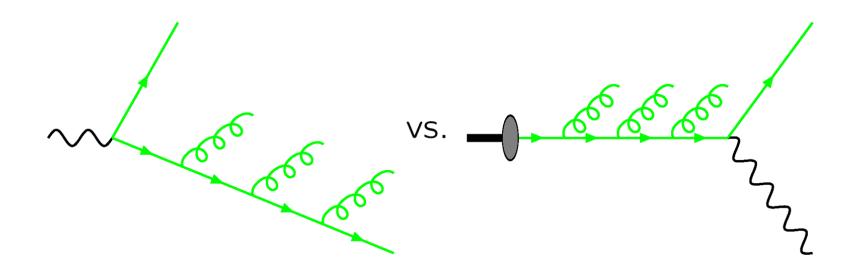

**Event Generators 1** 

NO:

#### Initial state radiation

In principle identical to final state (for not too small x)

In practice different because both ends of evolution fixed:

Use approach based on evolution equations...

**Event Generators 1** 

#### **Backward evolution**

DGLAP evolution: pdfs at( $x, Q^2$ ) as function of pdfs at ( $> x, Q_0^2$ ):

Evolution paths sum over all possible events.

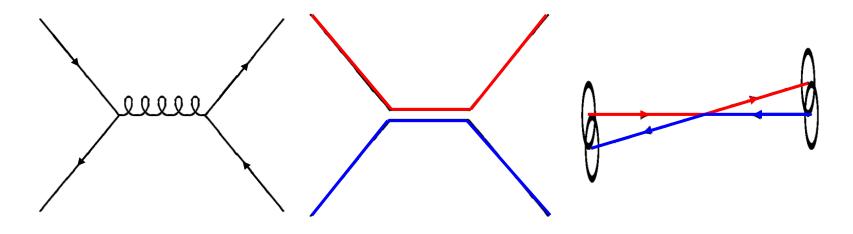

Formulate as backward evolution: start from hard scattering and work down in  $q^2$ , up in x towards incoming hadron.

Algorithm identical to final state with  $\Delta_i(Q^2, q^2)$  replaced by  $\Delta_i(Q^2, q^2)/f_i(x, q^2)$ . **Event Generators 1** 

## Hard Scattering

Sets up initial conditions for parton showers. Colour coherence important here too.

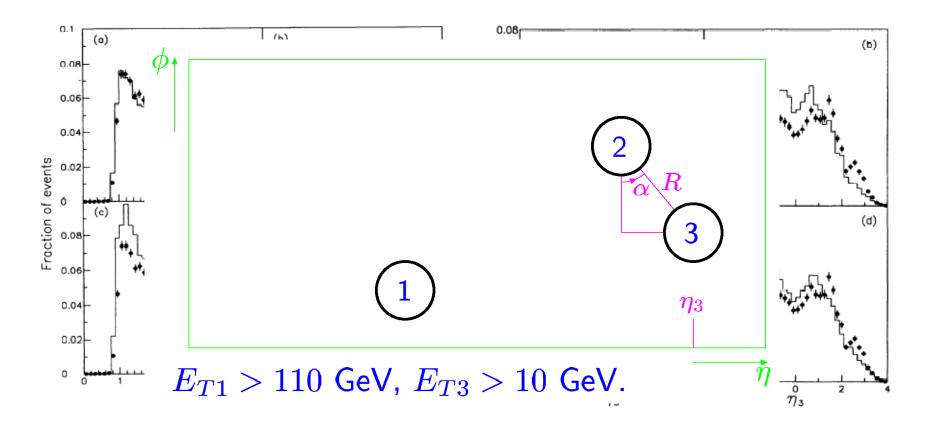

Emission from each parton confined to cone stretching to its colour partner

Essential to fit Tevatron data...

**Event Generators 1** 

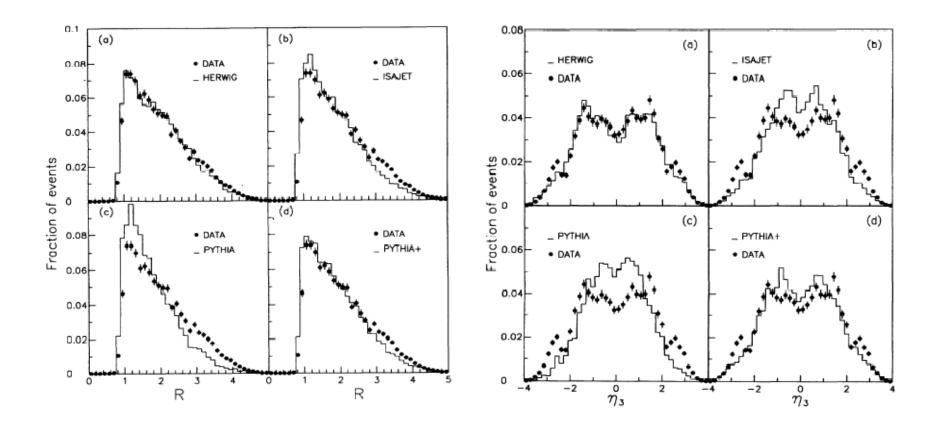

#### Distributions of third-hardest jet in multi-jet events

**Event Generators 1** 

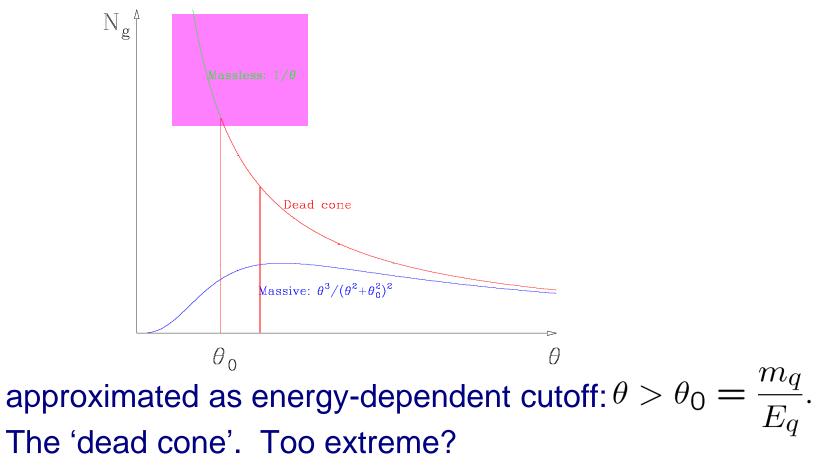

Distributions of third-hardest jet in multi-jet events HERWIG has complete treatment of colour coherence, PYTHIA+ has partial

**Event Generators 1** 

## Heavy Quarks/Spartons

look like light quarks at large angles, sterile at small angles:

Mike Seymour

#### Heavy Quarks/Spartons

More properly treated using quasi-collinear splitting:

 $\mathrm{d}\mathcal{P}_{\tilde{i}\tilde{j}\to ij} = \frac{\alpha_S}{2\pi} \,\frac{\mathrm{d}\tilde{q}^2}{\tilde{a}^2} \,\mathrm{d}z \,P_{\tilde{i}\tilde{j}\to ij}\left(z,\tilde{q}\right),$  $P_{q \to qg} = \frac{C_F}{1-z} \left| 1 + z^2 - \frac{2m_q^2}{z\tilde{q}^2} \right|,$  $P_{g \to gg} = C_A \left[ \frac{z}{1-z} + \frac{1-z}{z} + z (1-z) \right],$  $P_{g \to q \bar{q}} = T_R \left| 1 - 2z \left( 1 - z \right) + \frac{2m_q^2}{z \left( 1 - z \right) \tilde{q}^2} \right|,$  $\rightarrow$  smooth suppression  $P_{\tilde{g}\to\tilde{g}g} = \frac{C_A}{1-z} \left| 1+z^2 - \frac{2m_{\tilde{g}}^2}{z\tilde{q}^2} \right|,$ in forward region  $P_{\tilde{q}\to\tilde{q}g} = \frac{2C_F}{1-z} \left[ z - \frac{m_{\tilde{q}}}{z\tilde{a}^2} \right],$ 

Event Generators 1

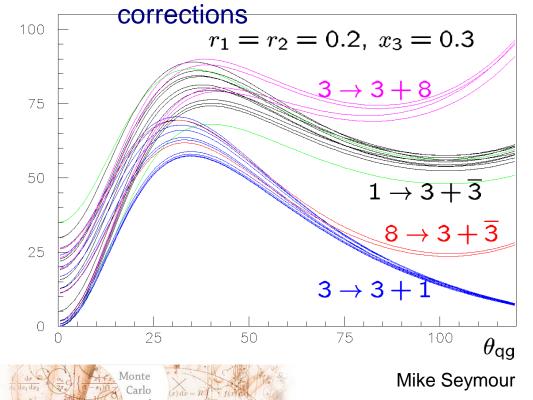

## Heavy Quarks/Spartons

- Dead cone only exact for
- emission from spin-0 particle, or
- infinitely soft emitted gluon

colour	spin	$\gamma_5$	example
$1 \rightarrow 3 + \overline{3}$			(eikonal)
$1 \rightarrow 3 + \overline{3}$	$1 \rightarrow \frac{1}{2} + \frac{1}{2}$	$1,\gamma_5,1\pm\gamma_5$	$Z^0 \to q \overline{q}$
$3 \rightarrow 3 + 1$	$\frac{1}{2} \rightarrow \frac{1}{2} + 1$	$1,\gamma_5,1\pm\gamma_5$	$t \to bW^+$
$1 \rightarrow 3 + \overline{3}$	$0 \rightarrow \frac{1}{2} + \frac{1}{2}$	$1,\gamma_5,1\pm\gamma_5$	$H^0 \to q \overline{q}$
$3 \rightarrow 3 + 1$	$\frac{1}{2} \rightarrow \frac{1}{2} + 0$	$1,\gamma_5,1\pm\gamma_5$	$t\tobH^+$
$1 \rightarrow 3 + \overline{3}$	$1 \rightarrow 0 + 0$	1	$Z^0 \to \tilde{q} \overline{\tilde{q}}$
$3 \rightarrow 3 + 1$	$0 \rightarrow 0 + 1$	1	$\tilde{q}\to \tilde{q}'W^+$
$1 \rightarrow 3 + \overline{3}$	$0 \rightarrow 0 + 0$	1	$H^0 \to \tilde{q}\overline{\tilde{q}}$
$3 \rightarrow 3 + 1$	$0 \rightarrow 0 + 0$	1	$\tilde{q} \to \tilde{q}' H^+$
$1 \rightarrow 3 + \overline{3}$	$\frac{1}{2} \rightarrow \frac{1}{2} + 0$	$1,\gamma_5,1\pm\gamma_5$	$\chi  ightarrow q \overline{\tilde{q}}$
$3 \rightarrow 3 + 1$	$0 \rightarrow \frac{1}{2} + \frac{1}{2}$	$1,\gamma_5,1\pm\gamma_5$	$\mathbf{\tilde{q}}  ightarrow \mathbf{q} \chi$
$3 \rightarrow 3 + 1$	$\frac{1}{2} \rightarrow 0 + \frac{1}{2}$	$1,\gamma_5,1\pm\gamma_5$	$t \to \tilde{t} \chi$
$8 \rightarrow 3 + \overline{3}$	$\frac{1}{2} \rightarrow \frac{1}{2} + 0$	$1,\gamma_5,1\pm\gamma_5$	$\tilde{g} \to q \overline{\tilde{q}}$
$3 \rightarrow 3 + 8$	$0 \rightarrow \frac{1}{2} + \frac{1}{2}$	$1,\gamma_5,1\pm\gamma_5$	$\tilde{q} \to q \tilde{g}$
$3 \rightarrow 3 + 8$	$\frac{1}{2} \rightarrow 0 + \frac{1}{2}$	$1,\gamma_5,1\pm\gamma_5$	$t\to \tilde{t}\tilde{g}$

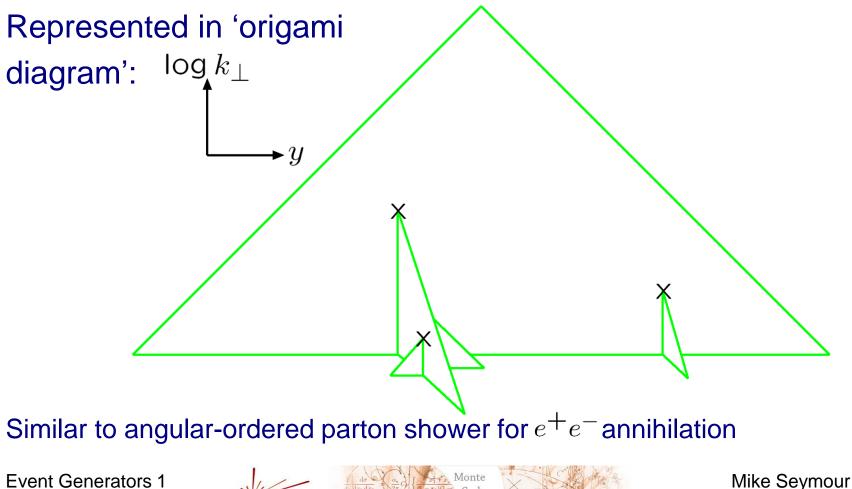

- In general, depends on
- energy of gluon
- colours and spins of emitting particle and colour partner
- → process-dependent mass

## The Colour Dipole Model

Conventional parton showers: start from collinear limit, modify to incorporate soft gluon coherence Colour Dipole Model: start from soft limit Emission of soft gluons from colour-anticolour dipole universal (and classical):  $d\sigma \approx \sigma_0 \frac{1}{2} C_A \frac{\alpha_s(k_\perp)}{2\pi} \frac{dk_\perp^2}{k_\perp^2} dy, \quad y = \text{rapidity} = \log \tan \theta/2$ After emitting a gluon, colour dipole is split: Event Generators 1 Mike Seymour

Subsequent dipoles continue to cascade c.f. parton shower: one parton  $\rightarrow$  two CDM: one dipole  $\rightarrow$  two = two partons  $\rightarrow$  three

## Initial-state radiation in the CDM

There is none!

- Hadron remnant forms colour dipole with scattered quark.
- Treated like any other dipole.
- Except remnant is an extended object: suppression

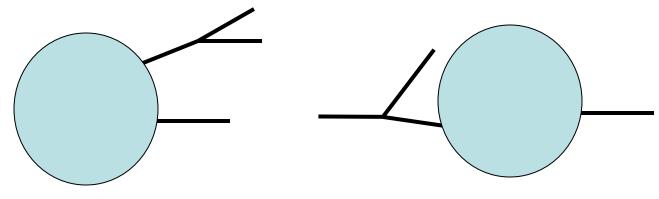

Biggest difference relative to angular-ordered  $\rightarrow$  more radiation at small x

**Event Generators 1** 

## **Dipole Cascades**

- Most new implementations based on dipole picture:
  - Catani & MHS (1997)
  - Kosower (1998)
  - Nagy & Soper (May 2007)
  - Giele, Kosower & Skands (July 2007) VINCIA
  - Dinsdale, Ternick & Weinzierl (Sept 2007)
  - Schumann & Krauss (Sept 2007) SHERPA
  - Winter & Krauss (Dec 2007) SHERPA

## **Matrix Element Matching**

Parton shower built on approximations to QCD matrix elements valid in **collinear** and **soft** approximations

 $\rightarrow$  describe bulk of radiation well  $\rightarrow$  hadronic final state

 $\rightarrow$  but ...

- searches for new physics
- top mass measurement
- *n* jet cross sections

• ...

- $\rightarrow$  hard, well-separated jets
- described better by fixed ("leading") order matrix element
- would also like next-to-leading order normalization

→ need matrix element matching Event Generators 1

## Older Programs, still sometimes seen

- PYTHIA 6.2: traditional  $q^2$  ordering; veto of non-ordered final state emission; partial implementation of angular ordering in initial state; big range of hard processes.
- HERWIG 6: complete implementation of colour coherence; NLO evolution for large x; smaller range of hard processes.
- ARIADNE: complete implementation of colour dipole model; best fit to HERA data; interfaced to PYTHIA for hard processes.

## **Supported Programs**

- PYTHIA 6.3: p<sub>T</sub>-ordered parton showers, interleaved with multi-parton interactions; dipole-style recoil; matrix element for first emission in many processes.
- PYTHIA 8: new program with many of the same features as PYTHIA 6.3, many 'obsolete' features removed.
- SHERPA: new program built from scratch; p<sub>T</sub>-ordered dipole showers; multi-jet matching scheme (CKKW) to AMAGIC++ built in.
- Herwig++: new program with similar parton shower to HERWIG (angular ordered) plus quasi-collinear limit and recoil strategy based on colour flow; spin correlations.

**Event Generators 1** 

## Summary

- Accelerated colour charges radiate gluons.
   Gluons are also charged → cascade.
- Probabilistic language derived from factorization theorems of full gauge theory.
   Colour coherence is a fact of life: do not trust those who ignore it!
- Modern parton shower models are very sophisticated implementations of perturbative QCD, but would be useless without hadronization models...
