# Characterisation of TimePix/MediPix3 assemblies for LHCb VELO upgrade

**Carlos Vázquez Sierra**

**August 16th 2012**

What is

**LOVE**  
**VELO**

?

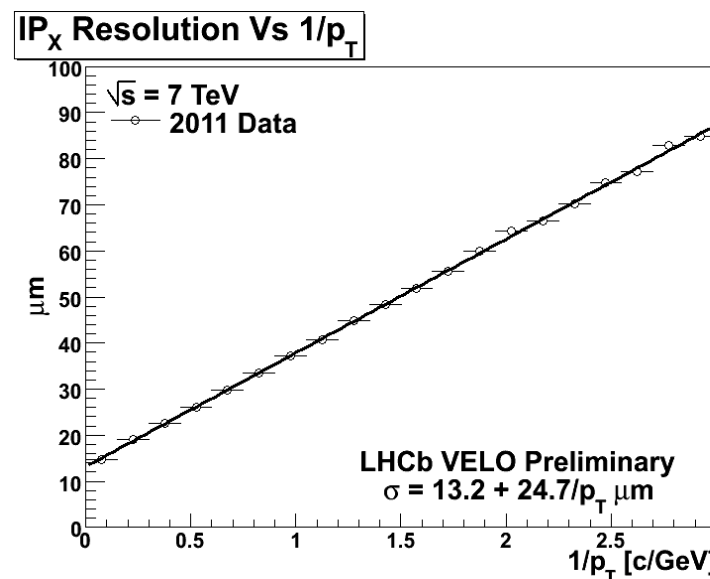

**Vertex LOcator (VELO): silicon strip sensors in vacuum used to measure trajectories close to collision point, in order to separate primary and secondary vertices.**

**3D schematic of LHCb experiment**

**> Best resolution of all vertex detectors in LHC!**

**> About 13  $\mu\text{m}$  IP (Impact Parameter) resolution at high momentum!**

# 2018 LHCb upgrade

**Current VELO assembly:**

> Composed by **strip detectors!**

**Main aims of VELO upgrade:**

- > Readout of **every** bunch crossing ( $\sim 40$  MHz)
- > Being able to work with **higher** luminosity!

Technology options

Pixel detectors

Strip detectors

And here is where I'm working.

# The road to VeloPix

## > TimePix:

- > ToT or ToA information for each pixel
- > Works by frames
- > Radiation hardness is not too high

## > MediPix3:

- > Only counting mode for each pixel
- > Works by frames
- > Radiation hard to the fluence expected in the upgrade

## > TimePix3:

- > Has both ToT and ToA
- > High hit rate (~ 40 MHz)
- > Data-driven readout
- > Radiation hard to the fluence expected in the upgrade

## > VeloPix:

- > Derived from TimePix3, specifically adapted for VELO
- > Higher hit rate (~ 400 MHz)

## All of them:

- > 55  $\mu\text{m}$
- > 256x256 pixels

# TimePix Telescope

Telescope planes

Telescope planes

Device Under Test (DUT)

## Telescope is used for:

- › Test different devices for LHCb upgrade
- › Gather experience with pixel detectors

## Telescope composition:

- › Telescope planes: TimePix
- › DUT: MediPix3, TimePix, Strip sensors ...

**Data analysis from the last  
testbeam (May 2012)**

(Finally, time to show some results...)

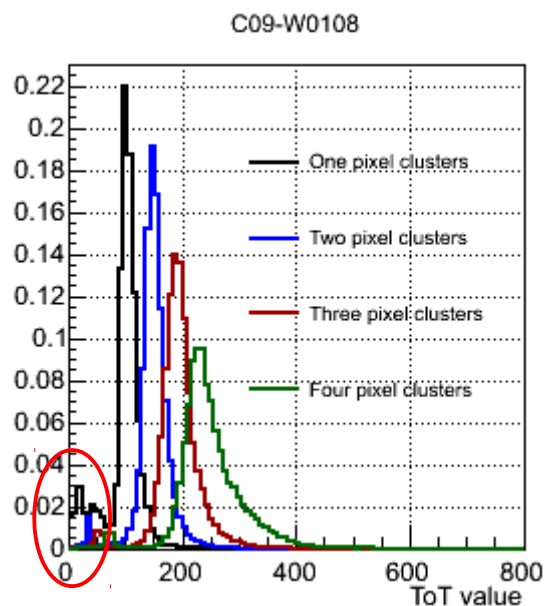

# Telescope performance

(Bias scan: data acquisition for different bias)

## Objective:

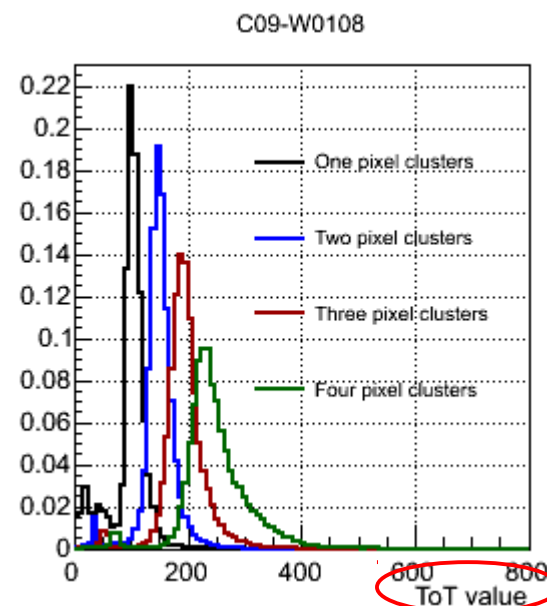

- > Study the performance of the telescope (only TimePix planes):
- > Try to improve the resolution. **How?**

### > ADC cuts:

Applying lower cuts in ToT (Time over Threshold) spectra, we exclude noise from track reconstruction!

### > ToT calibration:

Knowing the relation between charge and ToT values (due to a previous calibration with test pulses), we can speak in terms of charge, instead of ToT values.

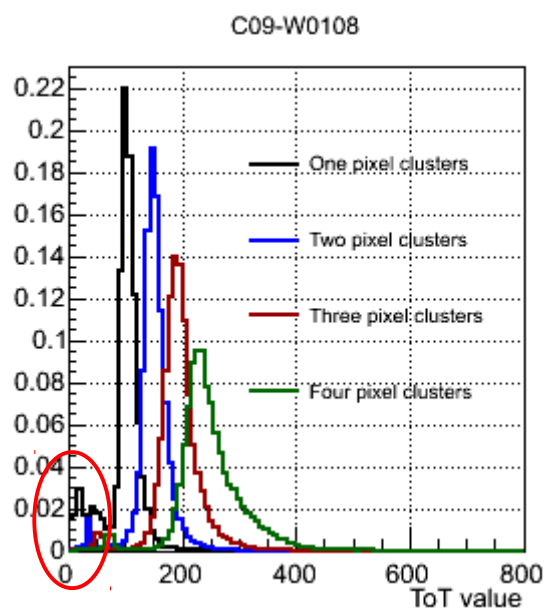

# Telescope performance

(Bias scan: data acquisition for different bias)

## Objective:

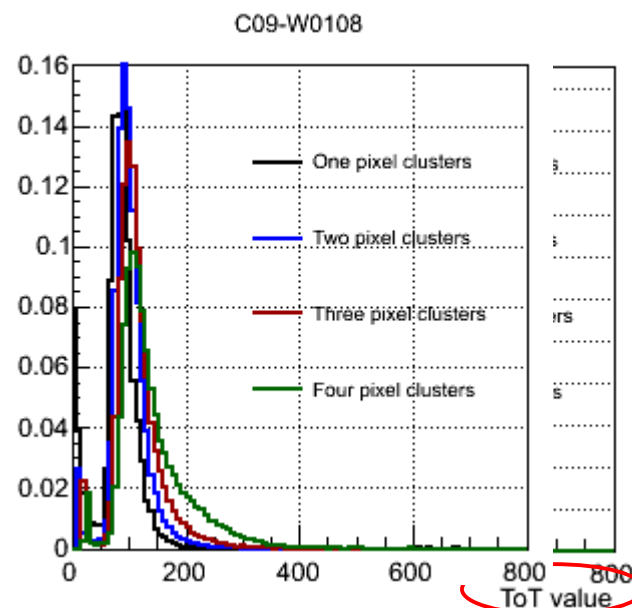

- > Study the performance of the telescope (only TimePix planes):
- > Try to improve the resolution. **How?**

### > ADC cuts:

Applying lower cuts in ToT (Time over Threshold) spectra, we exclude noise from track reconstruction!

### > ToT calibration:

Knowing the relation between charge and ToT values (due to a previous calibration with test pulses), we can speak in terms of charge, instead of ToT values.

# Telescope performance

(Bias scan: data acquisition for different bias)

**Objective:**

D04-W0015

OVER THRESHOLD, SPECTRA, WE EXCLUDE noise from track reconstruction!

(Bias scan: data acquisition for different bias)

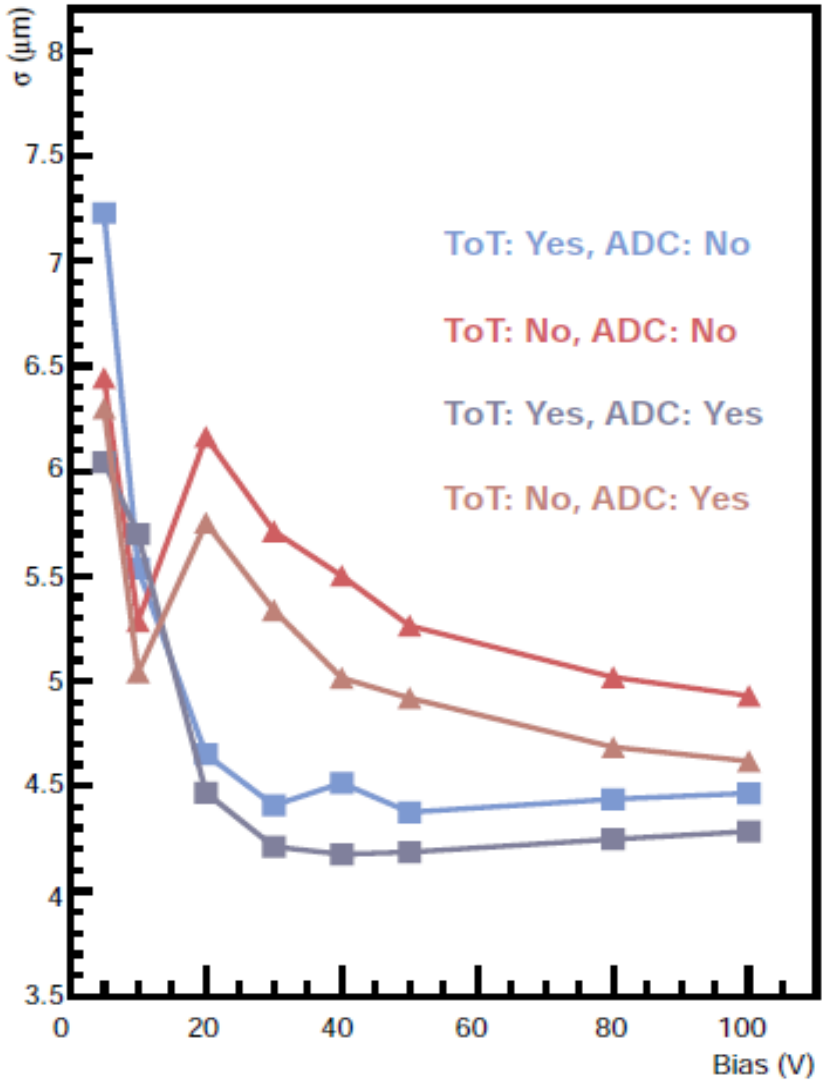

F11-W0108

**Objective:**

over threshold, spec noise from track re

es):

**ibration:**

108

ion between charge and  
to a previous calibration  
we can speak in terms of  
instead of ToT values.

# So, what's next?

- > Compare the charge loss before and after irradiating the sensors! Why?
  - > It's a way to test the radiation hardness of the sensors...

But, as a main objective:

- > VELO needs devices which can cover all the active area with minimum losses. So,
  - > We want to study the behaviour of the sensors after and before being irradiated, in order to improve them and achieve the main objective!
- > We only have one pixel detector which stands the irradiation process: MediPix3.
  - > Last testbeam (May): data from non-irradiated samples
  - > Next testbeam (Now!): data from irradiated samples

# MediPix3 efficiency study

(Threshold scan: data acquisition for different threshold)

## Objective:

- > Study the efficiency of the MediPix3 (DUT):
- > Study the number of reconstructed tracks with and without DUT:

Clusters per event vs. THL

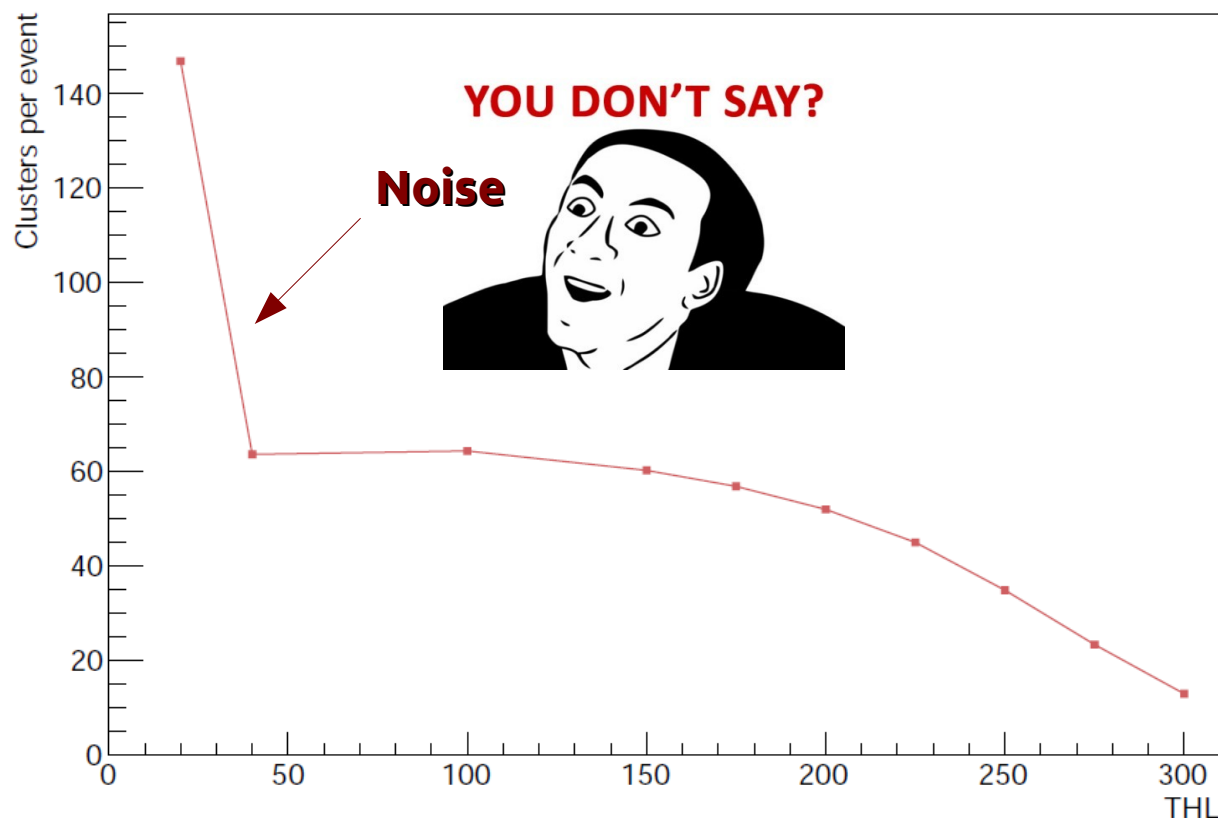

# MediPix3 efficiency study

(Threshold scan: data acquisition for different threshold)

## Objective:

- > Study the efficiency of the MediPix3 (DUT):
- > Study the number of reconstructed tracks with and without DUT:

Clusters per event vs. THL

# MediPix3 efficiency study

(Threshold scan: data acquisition for different threshold)

## Objective:

- > Study the efficiency of the MediPix3 (DUT):
- > Study the number of reconstructed tracks with and without DUT:

Clusters per event vs. THL

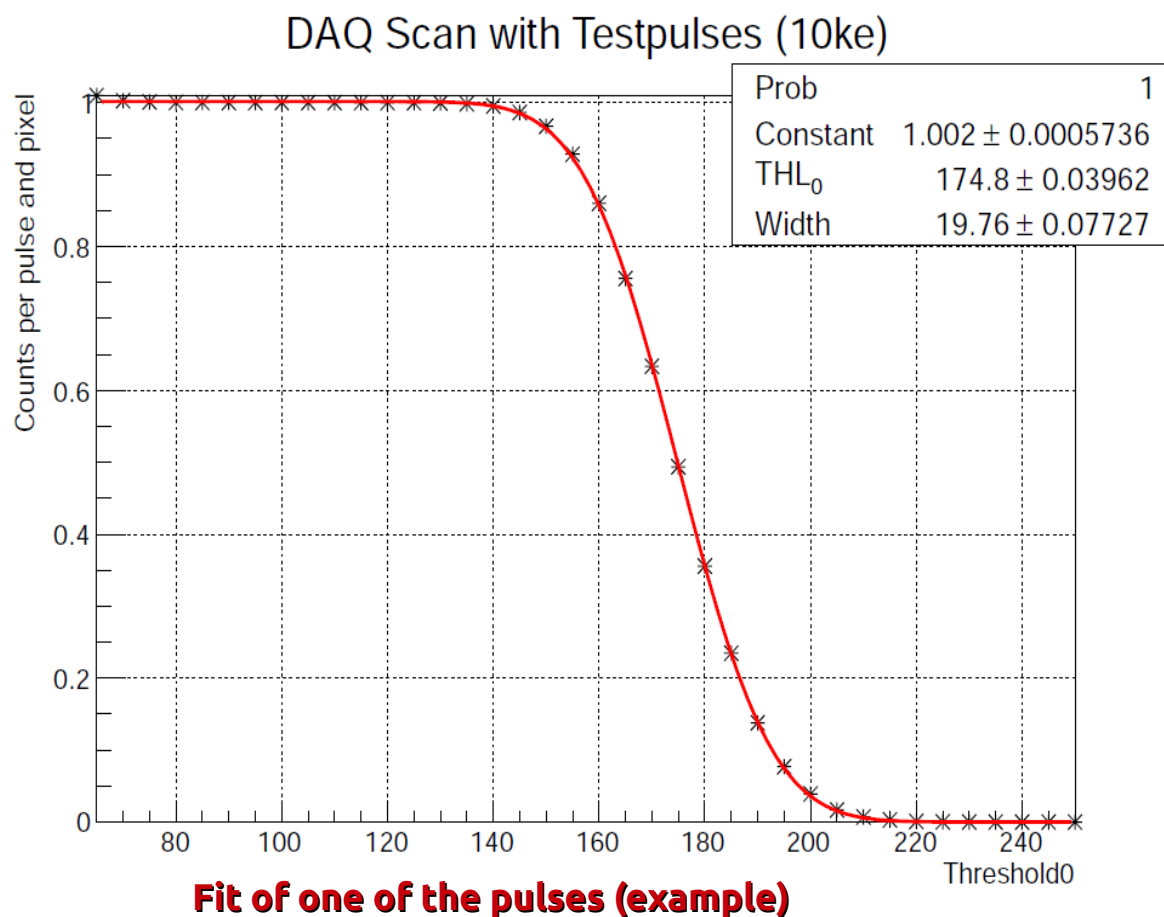

# MediPix3 calibration

(Threshold scan with test pulses (TP))

## Objective:

- > Obtain a relation (should be **linear**) between charge (injected with TP) and threshold:

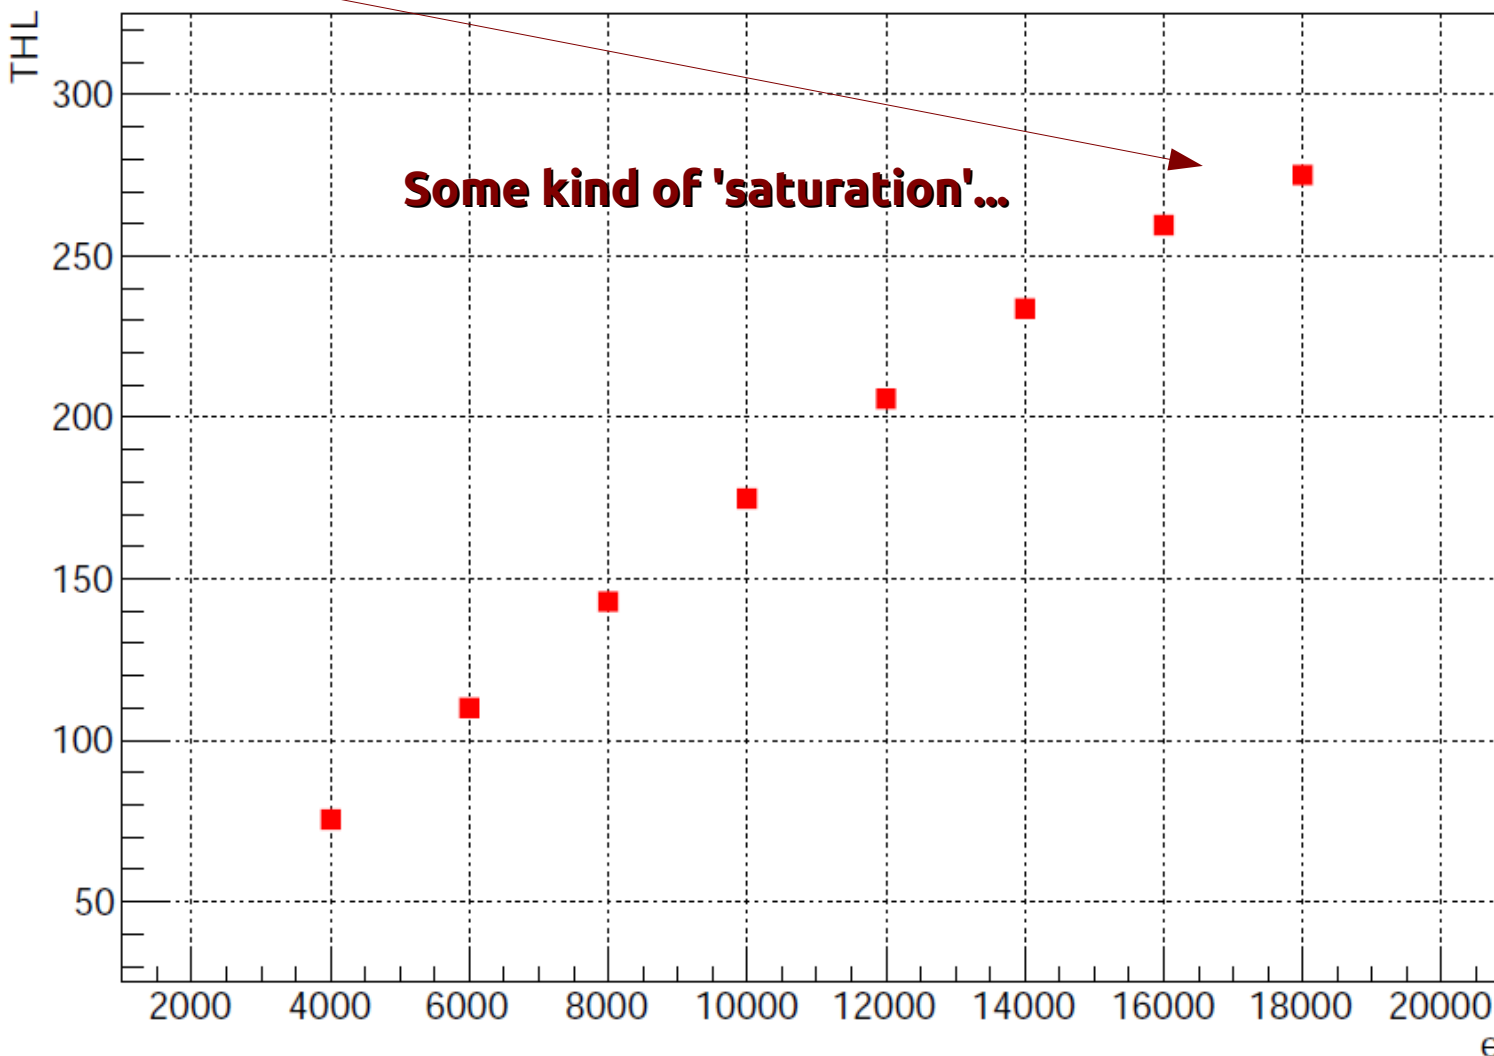

# MediPix3 calibration

(Threshold scan with test pulses (TP))

**Objective:** It's almost linear! Let's see what happens for higher charge..

➤ Obtain and th

# MediPix3 calibration

(Threshold scan with test pulses (TP))

**Object**  $THL$

➤ **Obtain**  
**and t**

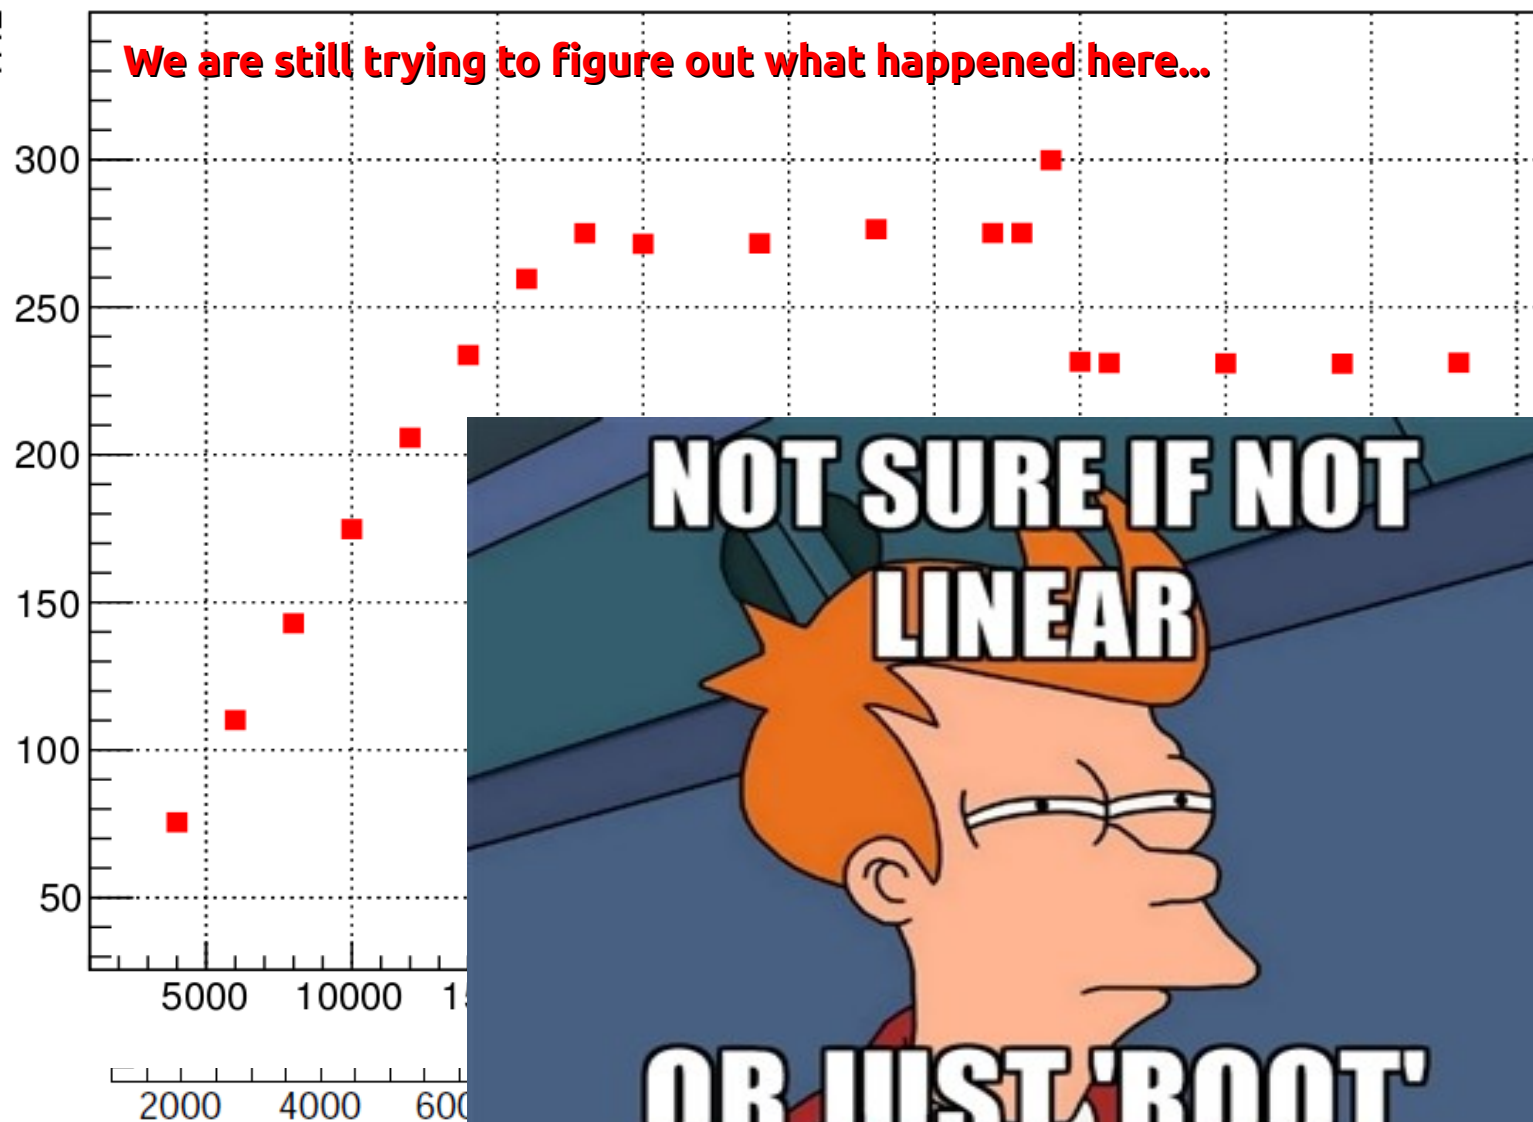

# MediPix3 calibration

(Threshold scan with test pulses (TP))

Object THL

› Obtain and t

# MediPix3 calibration

(Threshold scan with source)

## Objective:

➤ Cross check the results obtained with the threshold scan done with TP!

## Results:

# MediPix3 calibration

(Threshold scan with source)

## Objective:

- Cross check the results obtained with the threshold scan done with TP!

## Results:

**Nothing.**

# MediPix3 calibration

(Threshold scan with source)

## Objective:

- Cross check the results obtained with the threshold scan done with TP!

## Results:

**Nothing.**

**Still working...**

**Thank you for your attendance!**
