Anisotropic flow of identified particles in Pb-Pb collisions at $\sqrt{sN} N = 2.76$ TeV with the ALICE detector

Tuesday, 23 July 2013 14:00 (20 minutes)

Anisotropic flow is an important observable to study the properties and the evolution of the system created in heavy-ion collisions. We present measurements of anisotropic flow of strange and multi-strange particles, including Ks, Λ , Ξ , Ω and φ , in Pb–Pb collisions at \sqrt{s_{NN}} = 2.76 TeV recorded with the ALICE detector. The results are compared to hydrodynamic model calculations, blast-wave fit and the measurements at top RHIC energy. Particle mass dependence and scaling with the number of quarks of the anisotropic flow will be also discussed.
