Resonance Production in $\sqrt{s} = 7$ TeV pp collisions with ALICE.

Thursday, 25 July 2013 16:50 (20 minutes)

The study of pp collisions at LHC energies is important not only as a baseline for future analysis in heavy-ion events at ALICE but also aiding in the calibration of QCD inspired models for LHC energies. ALICE has measured the ρ^0 , Σ and Ξ resonances in pp collisions at $\sqrt{s} = 7$ TeV. This presentation will give an overview of the obtained results including transverse momentum spectra, ratios between the yields of these resonances and stable particles and $\langle p_T \rangle$.
