

## Signal formation in detectors

*Tuesday, 9 April 2013 15:40 (1h 10m)*

A large variety of different detector technologies are used in present particle physics experiments. The basic principle of signal formation, namely the induction of currents on metallic electrodes by moving charges, is however common to most of these detectors types. We will review the basic theorems of signal formation in particle detectors and will apply them to a few classic detector geometries.
