

Creating a common understanding on Adverse events information requirements

CCC-TI

Isabelle Laugier

Nov 2nd 2012

BE-OP-TI environment

- The **TI** operates 24 hours a day, 365 days a year monitoring the entire technical infrastructure of CERN.
- Different domains:
 - the electrical distribution network including **energy consumption** (works only if your computer has the rights).
 - heating, cooling, ventilation and air conditioning equipment
 - safety installations and cryogenic systems
 - coordination and reporting after major infrastructure disruptions
 - Corrective maintenance

=> A simple software to deal with all these very different domains.

Main software: TI-Logbook

- Home made software using Apex technology developed in 2009
- Updated constantly since then, following the introduction of new products at Cern level (Infor EAM, impact, etc...) and the new requirements or requests
- The main request : Must be user friendly to be useable during rush! For each phone call, lots of different information may be entered in the logbook.

The

The screenshot shows a web browser window titled 'Global list - Windows Internet Explorer provided by CERN'. The address bar shows the URL: https://apex.cern.ch/pls/htmidb_edmsdb/f?p=139:11:787908354450401::NO. The browser's Favorites bar shows the current page as 'Global list'.

The page content includes a navigation menu with tabs: 'Logbook', 'Operation', 'Tools', 'Meri', 'Admin', and 'TIOC'. Below this is a 'Global list filter' section with the following options:

- From: 16-OCT-2012
- To: 31-OCT-2012
- Find:
- Clear Filter
- Ongoing Work
- Minor event
- Test de Quart
- Note
- WW report
- TIOC Minutes
- LHC access
- Major event
- CERN alert
- Shift summary

The main section is titled 'Global list' and contains a table with the following columns: Date, Location, Subject, Category, Author, Status, and icons for edit and delete. The table lists various events from October 31, 2012, including ongoing work, notes, and incidents.

TI summary, week 44 2012

day	events
Monday, October 29	<ul style="list-style-type: none">EDF on site to try to find the cable fault again. This time we keep the SPS running. EDF found nothing and wants to come back and try again when the machines are off. Invited to try coming Wednesday morning while SPS is off for the optical fibre job anyway.

TI summary, week 43 2012

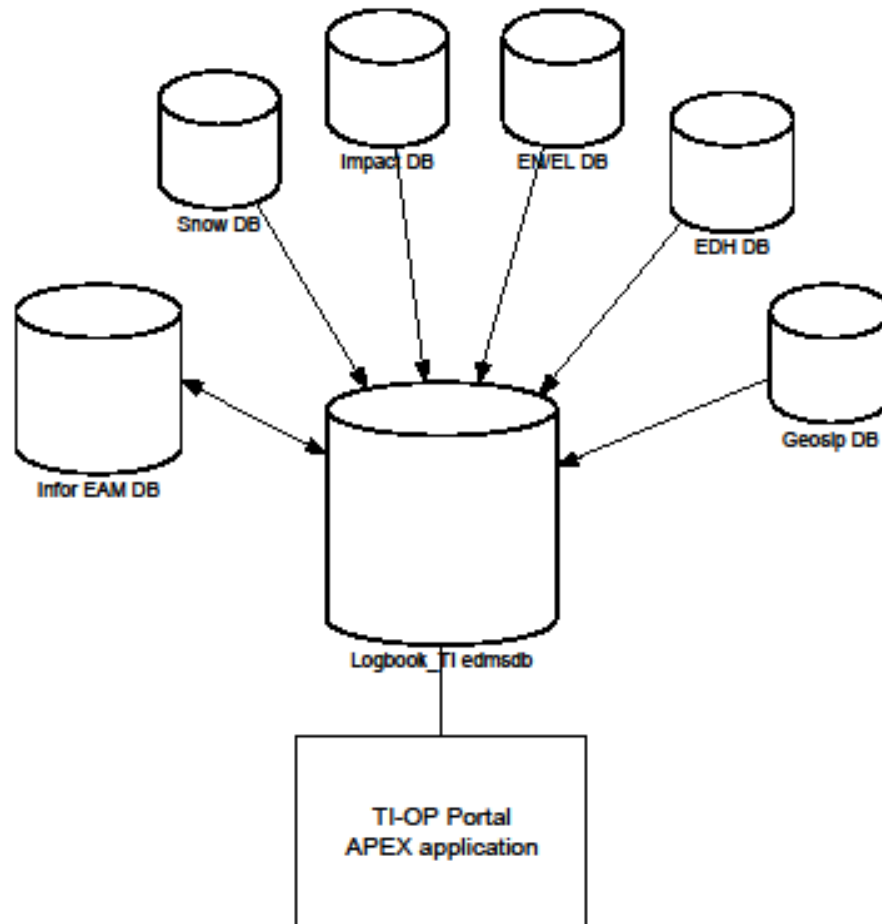

day	events
Tuesday, October 23	<ul style="list-style-type: none">03:55 -- Electrical glitch (9% dip during 70ms). 400kV trip near Chavanod. SPS RF and LHC FMCM trip.  19:45 -- UJ16 PAD does not work. LHC operators call in specialist Sege di Luca to fix it. 2.45 lost for LHC according to eLogbook. No alarm seen in TI. No ODM created. Ideally, LHC operators should have gone through TI to request piquet intervention.  23:33 -- A couple of seemingly inoffensive ventilation alarms on BA6...
Wednesday, October 24	<ul style="list-style-type: none">01:15 -- SPS septa cooling circuit in BA6 fails as a consequence of a power trip that also generated the ventilation alarms from earlier. TI and CV on site to switch tripped breaker back on. LHC was about to fill so lost about an hour of time. This could have been avoided had there been an alarm indicating a problem with the chilled water production at 23:30 already. Intervention by CV in the afternoon. No real problem found, some nuts tightened and inspections made. We are waiting for alarms to be configured.
