

Tarball Delight:

Some questions to you lot concerning relocatable WN and UI software.

- If you were to use a relocatable distribution - how'd you like your tarballs served?
 - Served up via CVMFS or local nfs?
 - Generic or VO specific?
- Why the lack of love for tarballs?
 - Lancaster were tarball users (and abusers) long before we **needed** to use them on our shared cluster.
 - It looks like more opportunities to plunder shared Uni clusters will present themselves – tarballs seem the best way to go on this front.
