HL-LHC Task 2.3 General Meeting

CERN, 11 October 2012

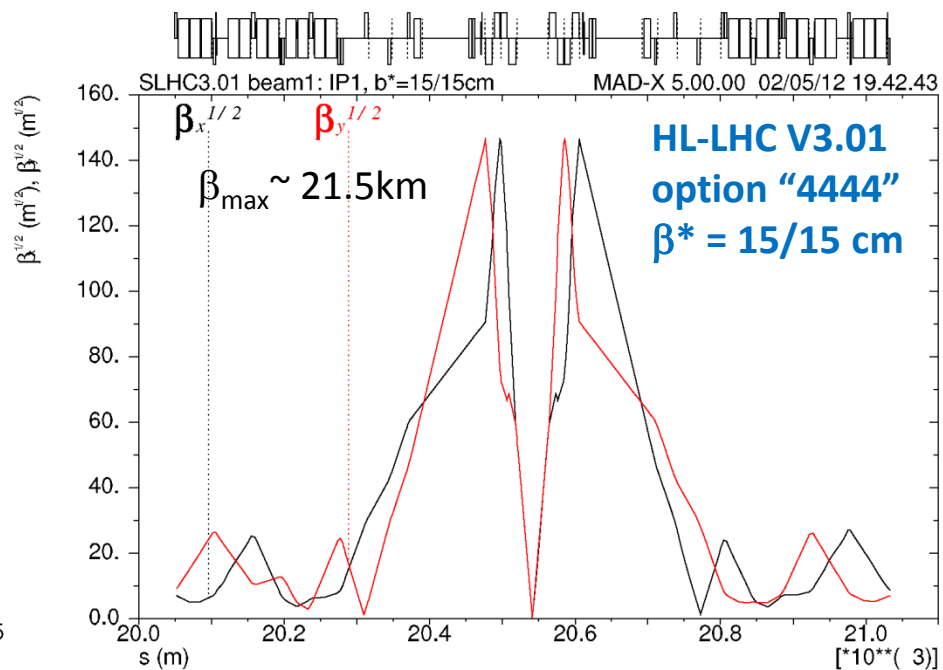

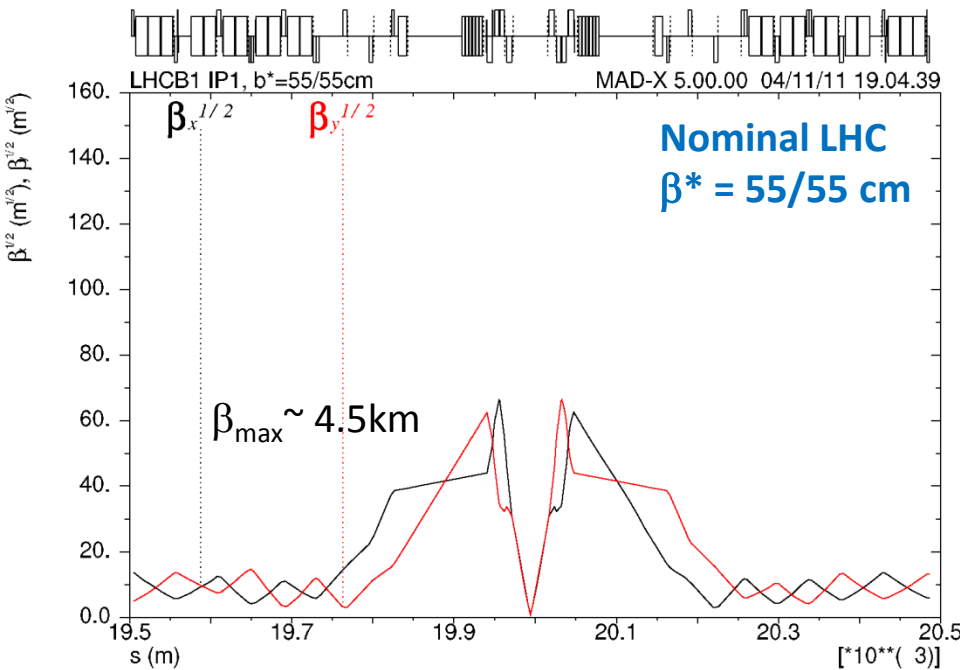

# Goals

- Previously performed study of dynamic aperture (DA) sensitivity to multipole field errors in the inner triplet (IT) quadrupoles with 120 mm coil aperture resulted in a self-consistent set of field tolerances producing minimum DA of  $12.3\sigma$ . These tolerances, however, are too tight relative to the expected achievable field quality in real magnets.
- Therefore, the goal for this study is to try to relax the tolerances towards the achievable field quality.
- This study is performed for the proposed IT quadrupoles with 150 mm coil aperture.
- The strategy to relax the tolerances includes setting a lower level for minimum DA ( $\sim 11\sigma$ ), a requirement for additional IT multipole field correctors, and fine tuning and balancing of multipole coefficients.

**Lattice:** HL-LHC V3.01, collision option “4444” with  $\beta^*=15/15$  cm at IP1 and IP5, Nb-Ti superconducting IT quadrupoles with 150 mm coil diameter and 120 T/m gradient, 7 TeV beam energy.

**Code:** SixTrack.

# Interaction Region $\beta$ -functions

- Large IT  $\beta$ -functions in the HL-LHC.
- Large 150 mm coil diameter in the new proposed superconducting IT quadrupoles Q1,Q2,Q3 will provide the necessary aperture and help relaxing the IT field tolerances.

# Multipole field scaling in a SC quadrupole

$$B_y + iB_x = 10^{-4} B_2 \times \sum_{n=2}^{\infty} (b_n + ia_n) \left( \frac{x + iy}{r_0} \right)^{n-1} \quad \text{where } n=2 \text{ is for a quadrupole, etc.}$$

$B_2$  is the main quadrupole field at  $r_0$

Note: the  $a_n, b_n$  coefficients are defined in  $10^{-4}$  units.

The  $a_n$  and  $b_n$  values are split in two components: the “uncertainty” term (deviation from systematic) and the “random” term. Their values in the presented field error tables correspond to sigma of a Gaussian distribution.

- **Scaling with reference radius  $r_0$**  does not affect dynamic aperture. Nominal  $r_0 = 17$  mm  $\rightarrow$  new IT quad  **$r_0 = 50$  mm**.

$$b_n, a_n \propto r_0^{n-2} \rightarrow (50/17)^{n-2}$$

- **Scaling with coil diameter  $d_c$**  in a SC quad (B. Bellesia, et al., Phys. Rev. ST-AB 10, 062401 (2007)). Nominal  $d_c = 70$  mm  $\rightarrow$  new IT quad  **$d_c = 150$  mm**.

$$b_n, a_n \propto 1/d_c^{n-1} \rightarrow (70/150)^{n-1}$$

- **Scaling with peak IT beta function  $\beta_{\max}$**  to keep the IT non-linear resonance driving terms constant (S. Fartoukh, SLHC Project Report 0038). Nominal  $\beta_{\max} = 4.5$  km  $\rightarrow$  new  **$\beta_{\max} = 21.5$  km**.

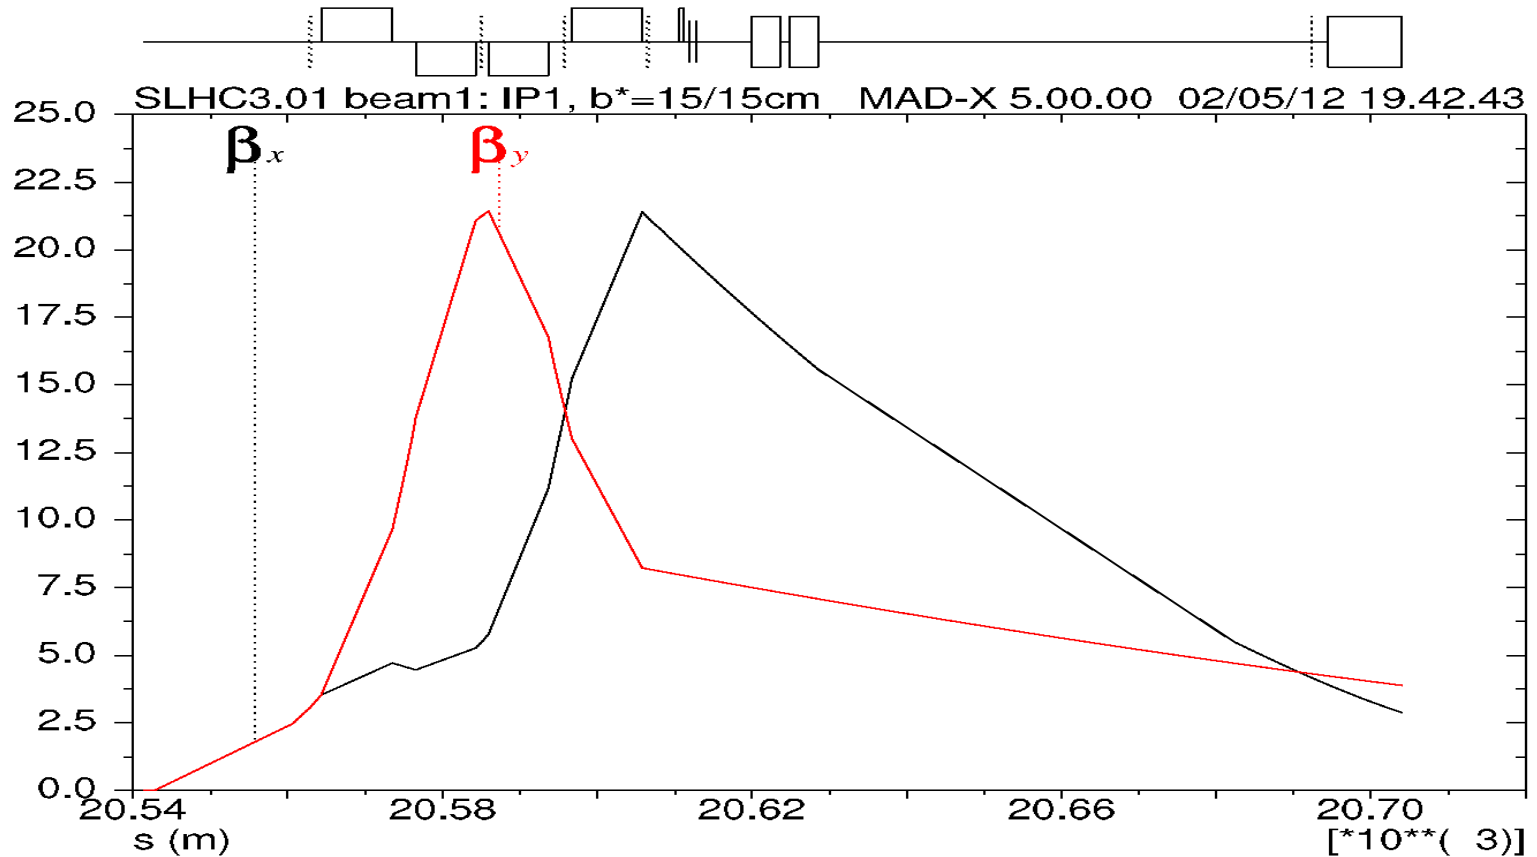

$$b_n, a_n \propto 1/\beta_{\max}^{n/2} \rightarrow (4.5/21.5)^{n/2}$$

# Multipole field correctors in the triplet

The a3, b3, a4, b4, b6 correctors compensate the corresponding errors of the IT field thus relaxing the tolerances. The a5, b5, a6 correctors are planned to be included, however they were not explicitly included in this study.

a3, b3, a4, b4, b6 correctors

# Set-up for long term SixTrack tracking

- 100,000 turns
- 60 random error seeds
- 30 particle pairs per amplitude step ( $2\sigma$ )
- 11 angles
- 7 TeV beam energy
- initial  $\Delta p/p = 2.7e-4$
- tune = 62.31, 60.32
- normalized emittance = 3.75  $\mu\text{m-rad}$
- IT multipole field correctors to compensate  $a_3, b_3, a_4, b_4, b_6$  terms are included (IT correctors for  $a_5, b_5, a_6$  terms have been added to the latest HL-LHC version, but not included in this study)
- Arc errors and correction are included
- No field errors in D1, D2 separation dipoles and Q4 quadrupoles (future study)

**Expected to achieve field quality for 150 mm aperture IT quadrupole at  $R_{ref} = 50$  mm based on magnet design estimates**

150 mm aperture,  $R_{ref}=50$  mm

“REVIEW OF ESTIMATES OF RANDOM COMPONENTS IN THE INNER TRIPLET”  
 E. Todesco, Hi-Lumi and LARP Collaboration Meeting, CERN, June 7, 2012

# Expected to achieve error table (by E. Todesco) scaled to $R_{ref} = 40$ mm (table “target4”)

For SixTrack simulations, we scale the expected to achieve field error table by E. Todesco for 150 mm IT quadrupole to  $R_{ref} = 40$  mm as this is hard wired in the code.

| skew | uncertainty | rms    |  | normal | uncertainty | rms    |

- These tolerances are based on approximately equal impact of each coefficient on DA while providing  $DA_{\min} > 12\sigma$ .
- This study showed that DA is not very sensitive to high order Anu coefficients.

# Optimization strategy

- The desired goal is to achieve field quality specified in the error table “target4”. There is also a possibility that with some effort the achievable field quality could be improved by as much as 50%. Therefore, the goal of this study is to obtain the most relaxed tolerances, ideally in the range of 50-100% values of the table “target4”.
- This requires a compromise on the level of acceptable DA and improvement of the IT field compensation.
- It was decided for this study to lower the level of  $DA_{\min}$  with the IT errors to about  $10.5\sigma - 11\sigma$ .
- Secondly, it was assumed that the IT correctors for A5, B5, A6 errors will be installed. Since these correctors are not yet implemented for this lattice, we artificially reduced the A5, B5, A6 errors assuming that these represent residual errors after correction.
- The individual multipole coefficients have to be optimized in order to relax and better balance the tolerances. This can be obtained by using various scans.
- The highest order coefficients may need to be better relaxed since their tolerances are likely more difficult to control.

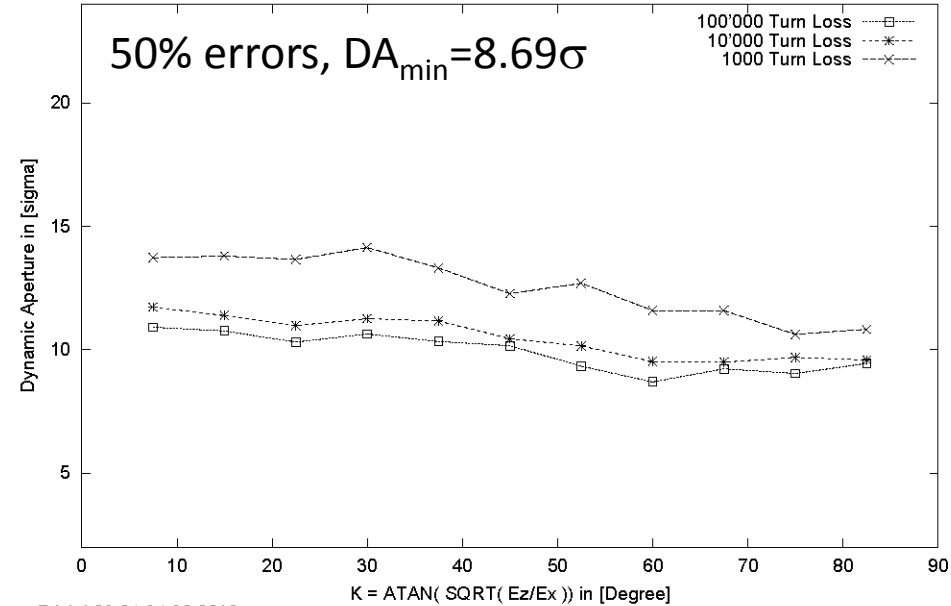

# Dynamic aperture at 100% and 50% of the “target4” values

jobslh301\_4444\_target4\_ITcor\_Arccor\_w1/62.31\_60.32/2-24/e5, D.A. of 60 seeds vs K (6d), 100000 Turns

Fri Jul 06 04:35:39 2012

jobslh301\_4444\_target5\_ITcor\_Arccor\_w2/62.31\_60.32/2-24/e5, D.A. of 60 seeds vs K (6d), 100000 Turns

Fri Jul 06 04:34:30 2012

The DA at 50% scale is not sufficient. Detailed optimization of various multipole coefficients is required.

# Scan of A5, B5, A6 assuming their IT correction is included

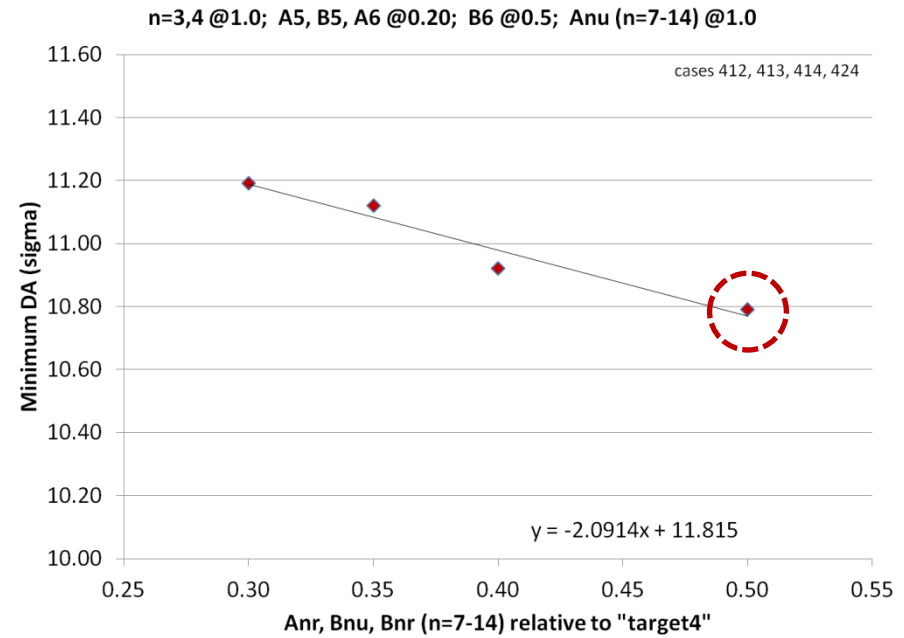

- This indicates that for  $\sim 11\sigma$  DA, one needs to have the residual A5, B5, A6 coefficients within 20-25% of "target4" or smaller.
- Note that in this scan the high order multipoles are not yet within the desired range.

# Scan of high order Anr, Bnu, Bnr (n=7-14) for two settings of A5, B5, A6 (20% and 25%)

A5, B5, A6 at 25%

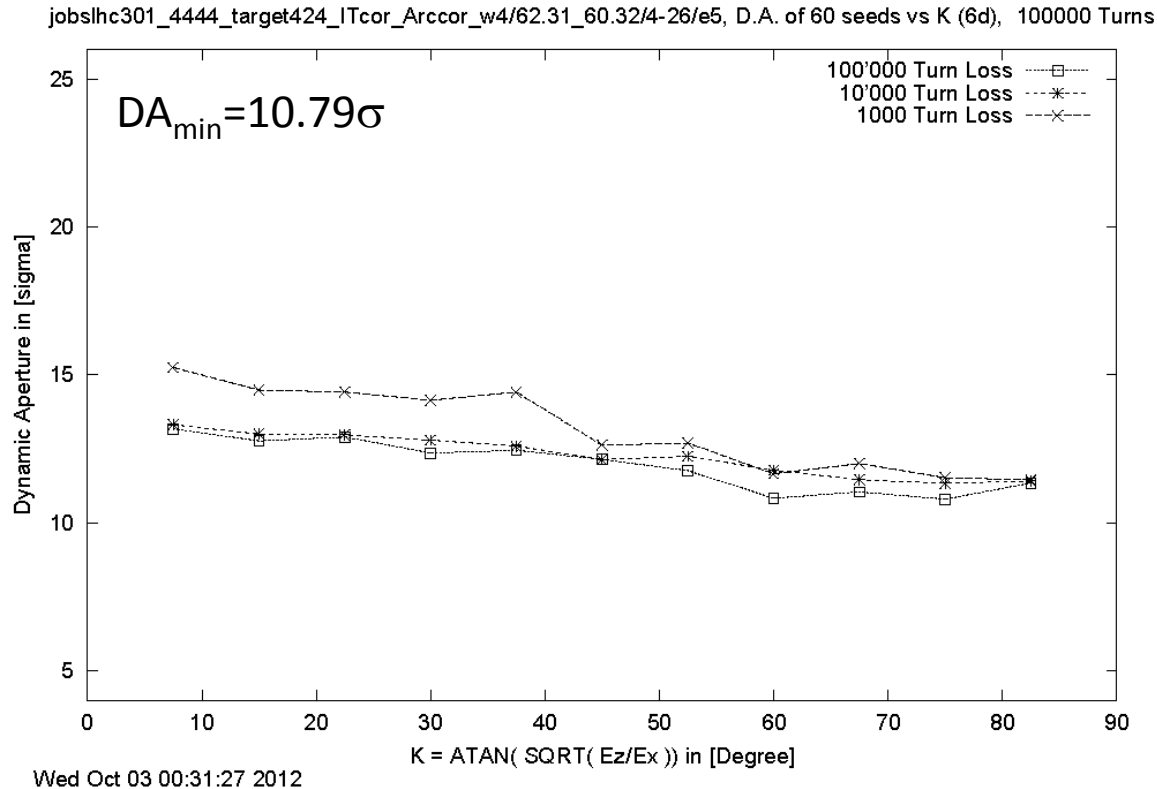

A5, B5, A6 at 20%

- The A5, B5, A6 values are assumed to be the residual values after IT correction.
- This indicates that in order to reach 50% tolerances for high order multipoles, the A5, B5, A6 residual errors after IT correction must be ~20% of "target4" values.
- The case shown by circle ("target424") has all coefficients at  $\geq 50\%$  values except A5, B5, A6 (assumed to be corrected). This is the starting point for high order scans.

# Dynamic aperture for error table “target424”

Settings relative to “target4”: n=3,4 at 100%; A5, B5, A6 at 20%; B6 at 50%; Anu (n=7-14) at 100%; Anr, Bn (n=7-14) at 50%.

This satisfies the bare minimum requirement for the  $\geq 50\%$  tolerance values. This is the starting point for more scans trying to relax high order multipoles.

# Scan of high order Bn (n=9-14)

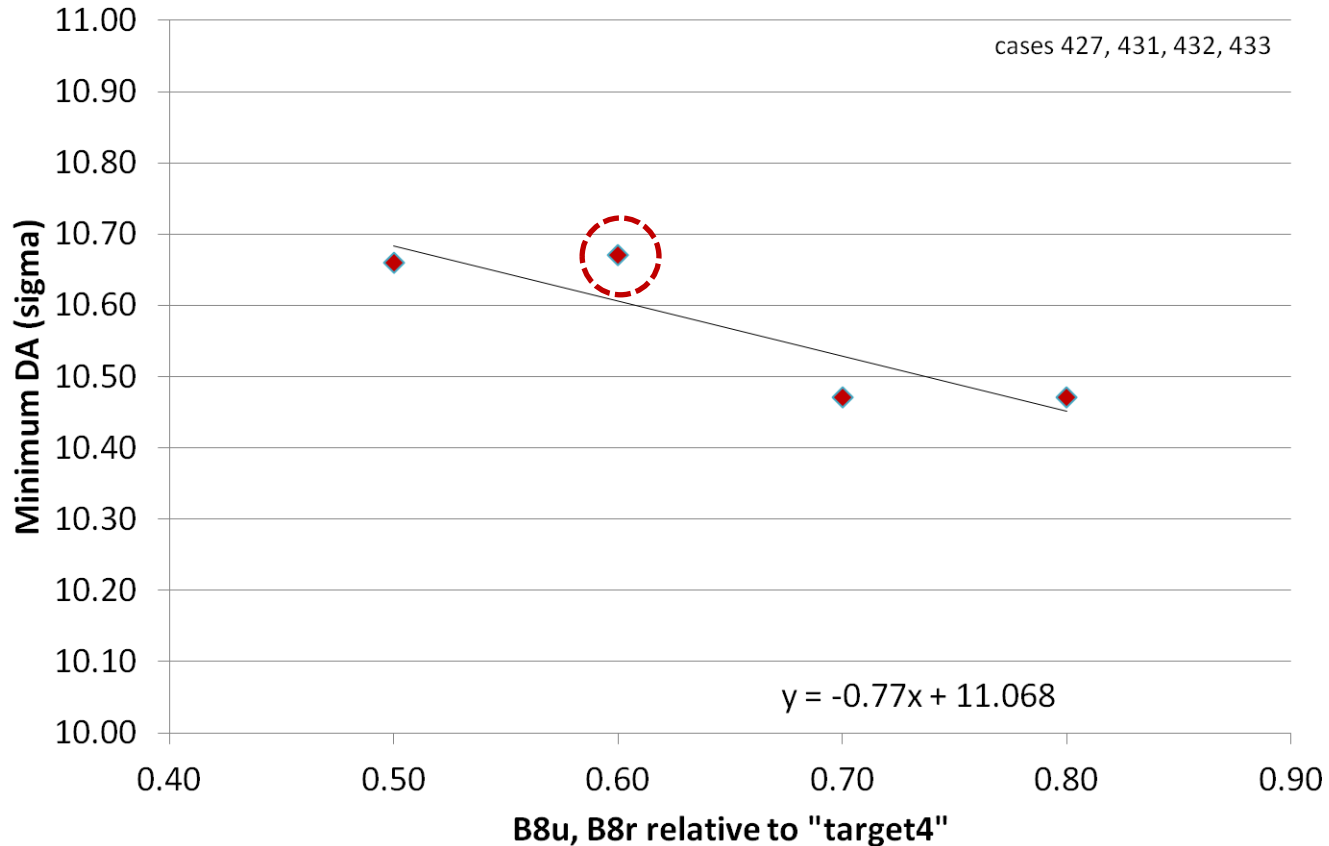

n=3,4 @1.0; A5, B5, A6 @0.2; B6 @0.5; B7, B8 @0.5;  
Anu (n=7-14) @1.0; Anr (n=7-14) @0.5

We require that  $DA > 10.6\sigma$ . This indicates that Bn (n=9-14) should be set to 70%. This setting ("target427") then will be used to scan B8 while still trying to keep the  $DA > 10.6\sigma$ .

# Scan of B8

n=3,4 @1.0; A5, B5, A6 @0.2; B6 @0.5; B7 @0.5; Anu (n=7-14) @1.0;  
Anr (n=7-14) @0.5; Bnu, Bnr (n=9-14) @0.7

To maintain  $DA > 10.6\sigma$  the B8 should be set to 60% ("target431").  
The next step is to scan B7 while trying to keep the  $DA > 10.6\sigma$ .

# Scan of B7

n=3,4 @1.0; A5, B5, A6 @0.2; B6 @0.5; B8 @0.6; Anu (n=7-14) @1.0;  
Anr (n=7-14) @0.5; Bnu, Bnr (n=9-14) @0.7

To maintain  $DA > 10.6\sigma$  the B7 is set at 50%.

This is the currently the best obtained setting named "target431".

## Error table “target431” normalized to “target4” values (in %)

| skew | uncertainty | rms |  | normal | uncertainty | rms |
|------|-------------|-----|--|--------|-------------|-----|
| a3   | 100         | 100 |  | b3     | 100         | 100 |

# Summary

- Settings for the IT field error tolerances have been optimized using various scans of the field coefficients. It provides that all uncorrected coefficients are within 50-100% range of the desired field quality based on magnet design estimates. This setting assumes good quality correction of A5, B5, A6 terms.
- This work is in progress. More optimization scans will be done to further improve this solution.
