

Hardware implications of IR upgrade: TAN, TAS & forward detectors

Anne Laure Perrot
on behalf of EN/MEF

Special thanks to
F. Butin, I. Efthymiopoulos, S. Evrard, F. Galleazi, D. Lacarrere

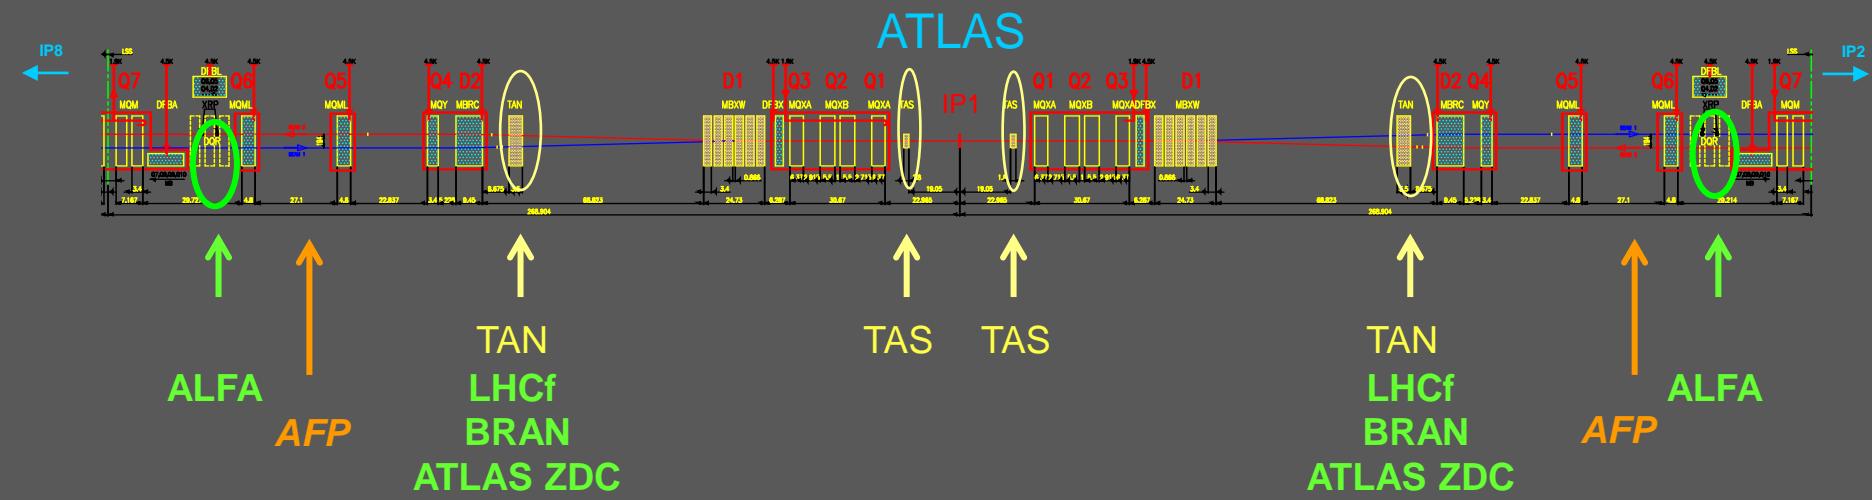

EN/MEF in charge of these elements

Contents

1. Locations of TAS, TAN & forward detectors at the end of LS1
 1. TAS
 2. TAN
 3. LHC forward detectors

Locations of TAS, TAN and forward detectors

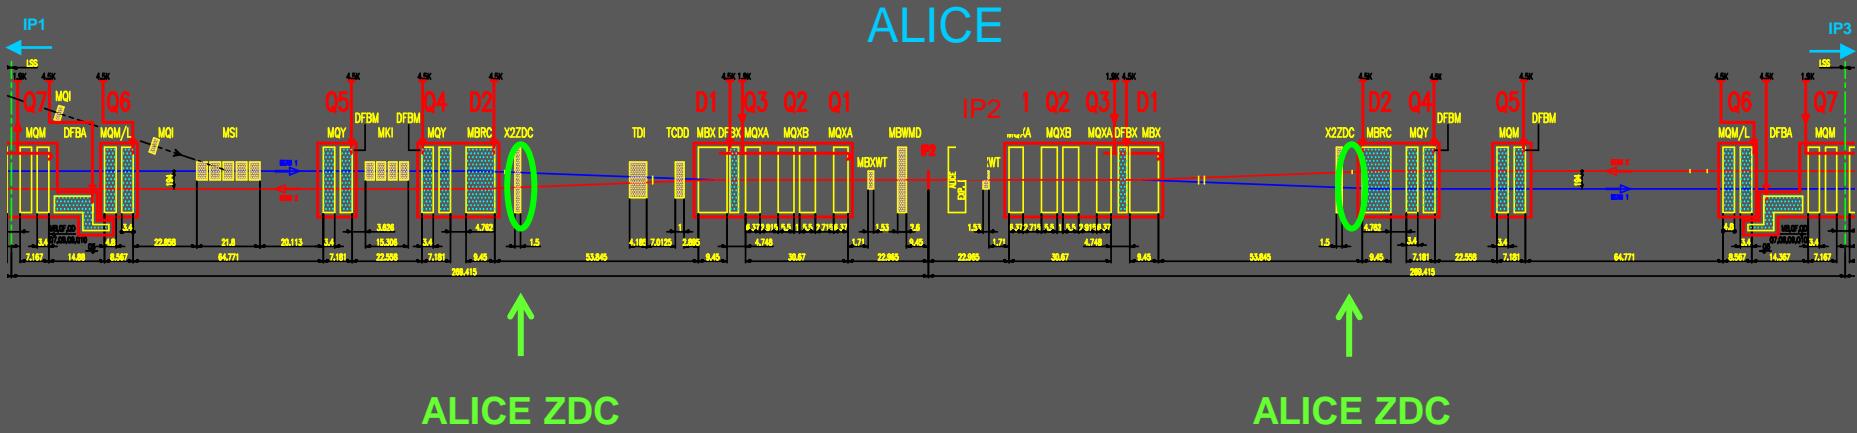

LSS1 – end of LS1

- Forward detectors - installed
- Forward detectors under study – installation foreseen during Xmas break 2015-2016

Locations of TAS, TAN and forward detectors

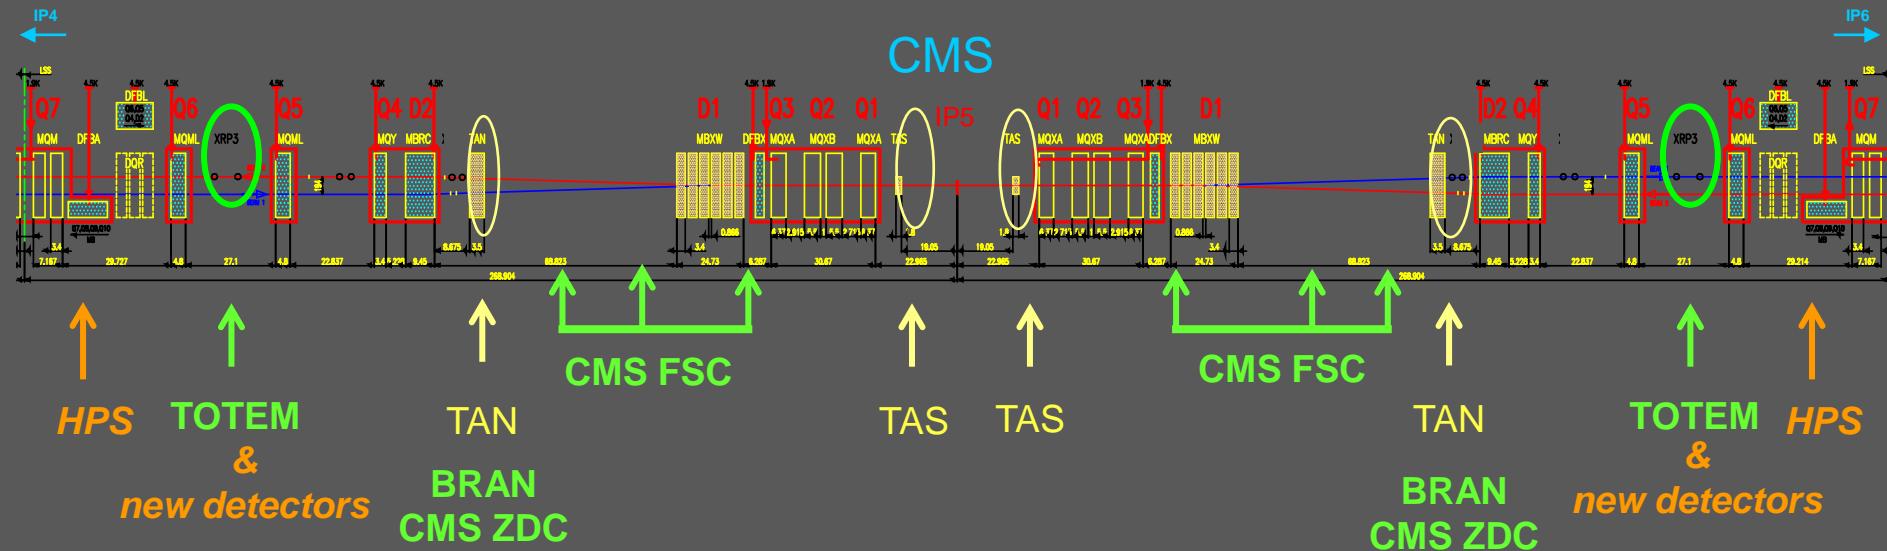

LSS2 – end of LS1

- Forward detectors - installed

Locations of TAS, TAN and forward detectors

LSS5 – end of LS1

- Forward detectors - installed
- Forward detectors under study

TAS (Target Absorbers Secondaries)

Purpose

- Front quadrupoles absorbers around IPs 1/5
Protect Q1,2,3 from debris (prevent them from quenching)
- Protect the inner tracking elements of ATLAS and CMS detectors from loss of beam particles in the IRs
- Forward shielding around TAS to protect ATLAS & CMS detectors from particles leaving the TAS (backscattering /activation)
- TAS designed to be an integral part of the forward shielding of ATLAS and CMS

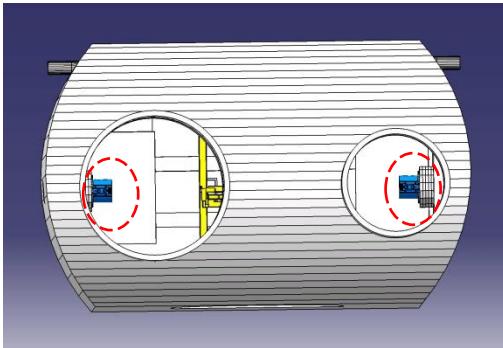

TAS (Target Absorbers Secondaries)

Technical specificities

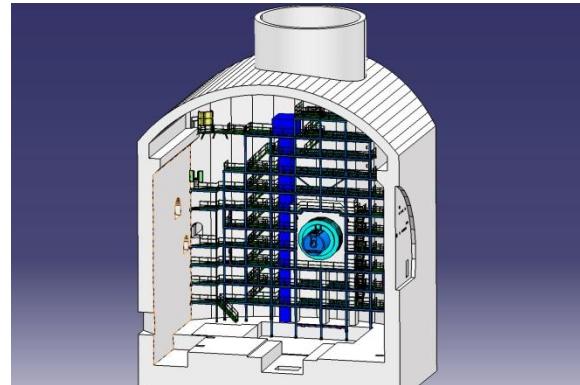

- Copper absorbers, 3.2 tons, internal beam tube, adjustable supports and alignment rods;
- In situ vacuum bake-out (strip heaters/ internal thermocouples)
- Cooling system (water) to ensure internal max beam tube temperature below 75 C
- Technical requirements: see edms 101559

TAS - ATLAS

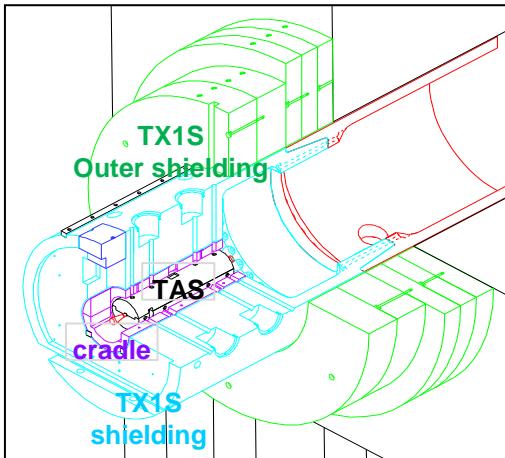

Location: inside TX1S shielding

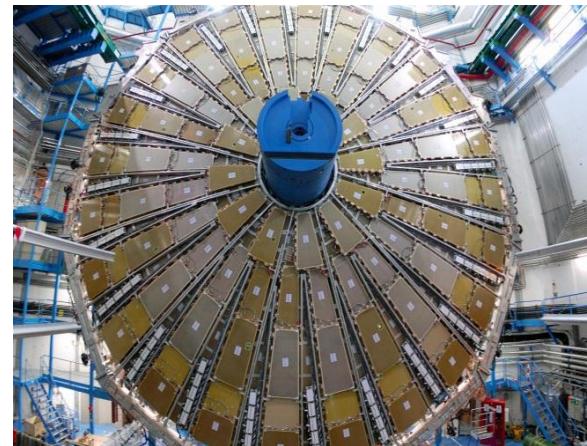

UX15 cavern – top view

UX15 cavern

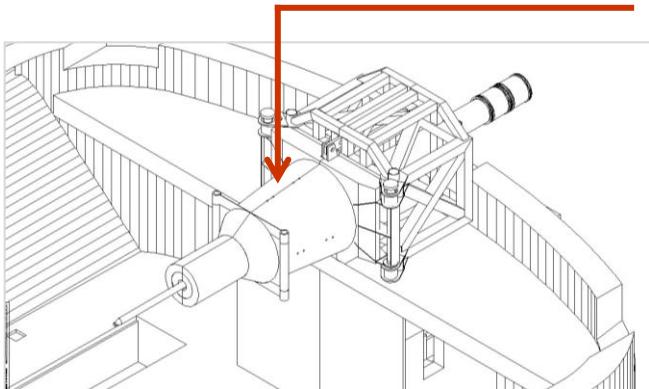

TX1S – internal view

TAS and TX1S – installation sequence

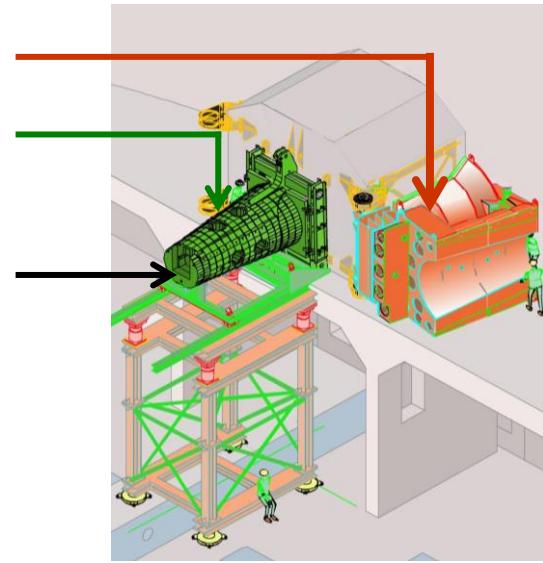

TAS – CMS

Location: inside the Fixed Iron Nose

UX55 cavern – TAS surrounding
Rotating shielding closed

Rotating Shielding
Fixed Iron Nose
(FIN)
TAS
inside FIN

UX55 cavern – TAS surrounding
Rotating shielding open

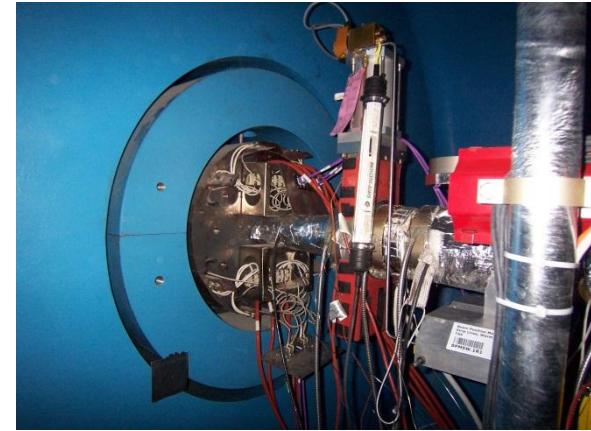

TAS and FIN – installation sequences

TAS – ATLAS & CMS

Technical issues for removal

- RP issues (ALARA)
- ATLAS TAS + cradle / CMS TAS + FIN
Weight of each assembly is 10 Tons
 - ➡ handling issues
- Services removal (heating/cooling/survey)
- Preliminary study by EN/MEF-EBE (F. Butin) (see edms:1254919)
- Exit via LHC tunnel:
 - might be considered in Pt1 but inner triplets to be dismantled first
 - not considered for Pt5 (tunnel vs cavern scenario – ALARA consideration)
- Exit via PX shaft (to be coordinated with ATLAS & CMS coordination team)

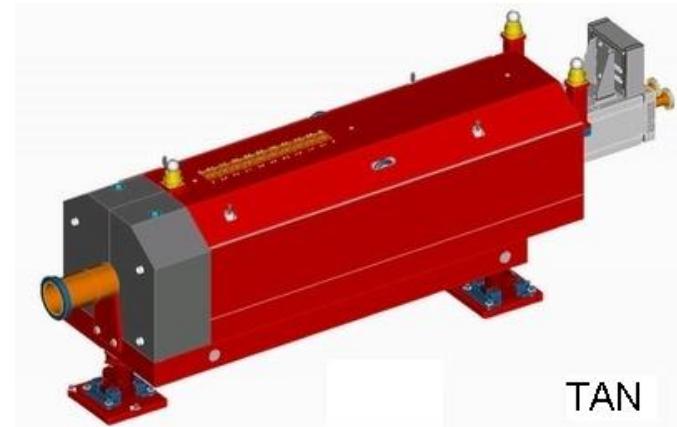

TSX1 shielding - view from LSS1 side

TAN (Target Absorbers Neutrals)

Purpose & technical specificities

- Absorbers to protect the SC dipoles D2 and the outer triplet quads (prevent them from quenching)
- Four around LHC (one on each side of IP1/5, @ 140m)
- Steel and marble, internal beam tube ‘y-chamber’, 29 tons,
- In situ vacuum bake-out (strip heaters/ internal thermocouples)

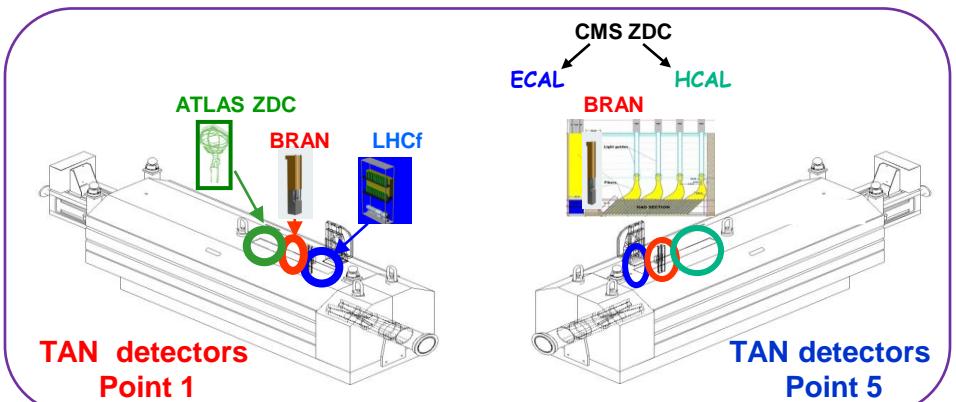

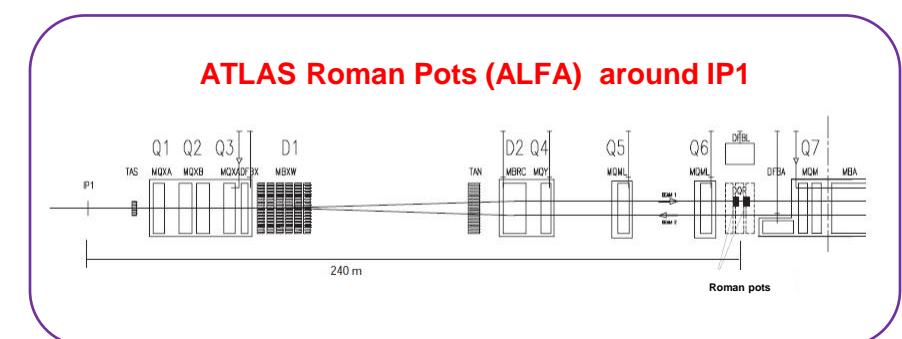

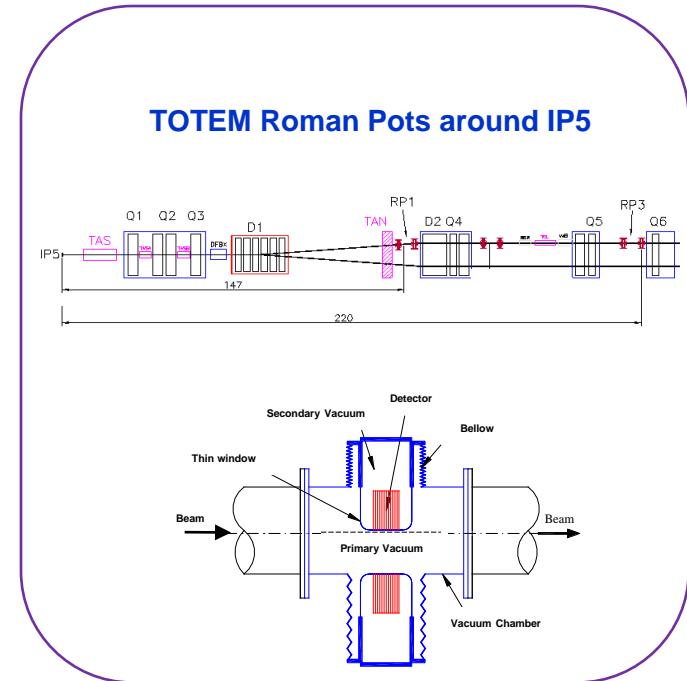

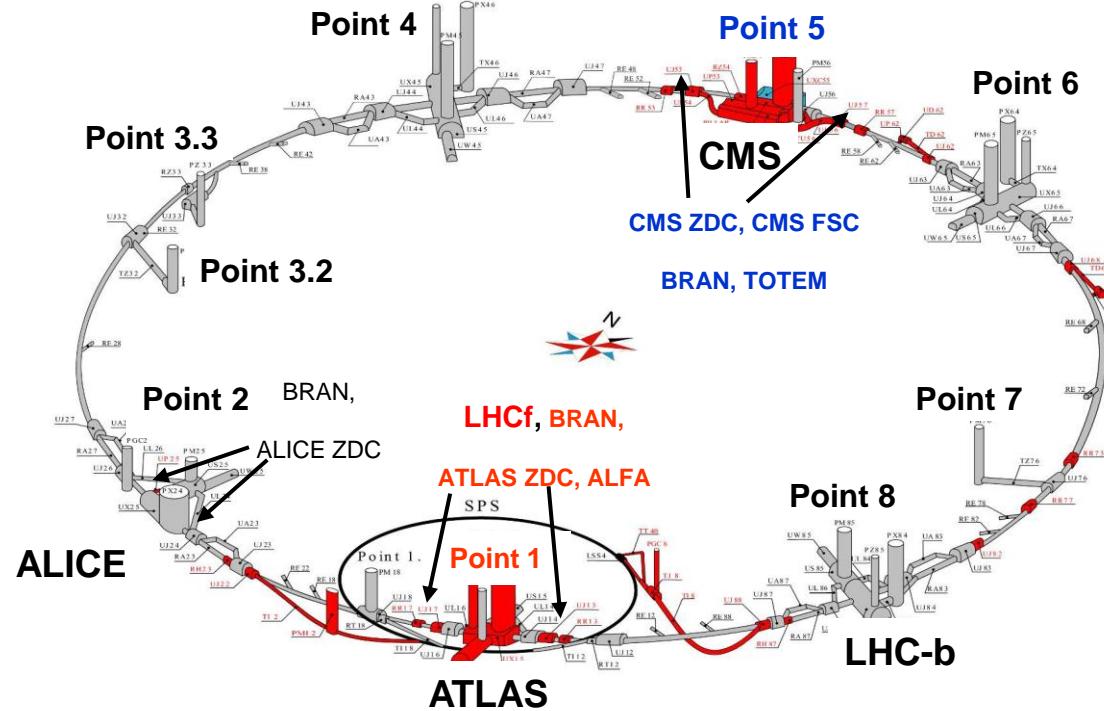

TAN – LSS1/5

Technical issues for removal

- RP issues (ALARA)
- Weight, dimension ➔ handling issues
- **TAN study group (since July 2012)**
 - Monthly meeting to study the issues linked to the TANs removal and define handling procedure for removal/displacement
 - Participants: EN/HE, RP, EN/MEF
 - Chairman: S. Evrard (EN/MEF-EBE)

LHC forward detectors

LTEX

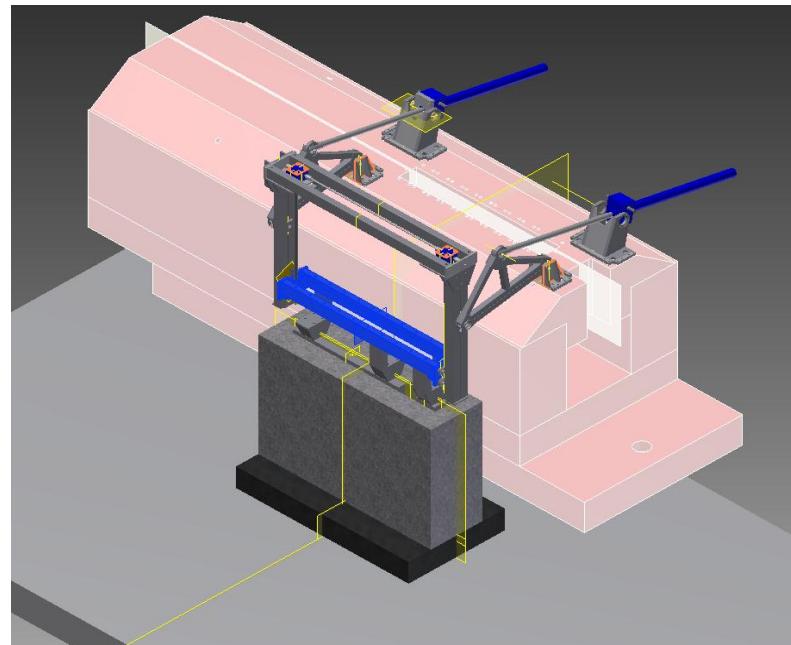

LHC forward detectors in TAN

LTEX

Removal procedure

Point 1 remote handling system
Installed in March 2009

Point 5 remote handling system
Under construction
Installation foreseen during LS1

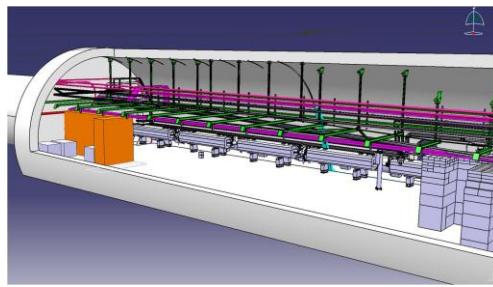

LHC forward detectors in TAN

Underground storage

- Dedicated sarcophagi for forward detectors transport and storage

- Storage bunkers in UJs around Pts1/5

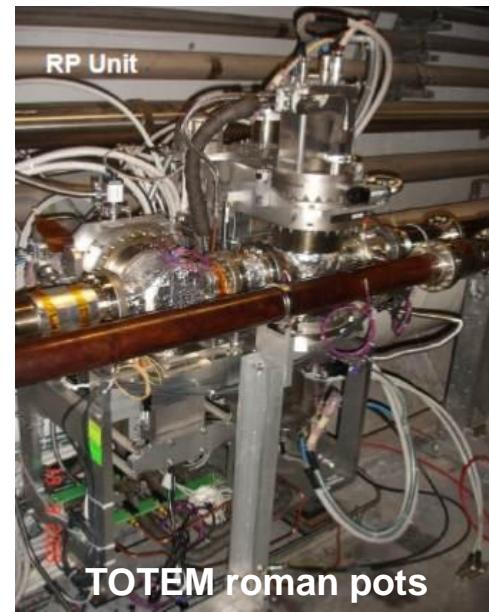

- If needed transport to surface via PMs

LHC forward detectors – TOTEM & ALFA

LATEX

Removal issues

- Detectors in secondary vacuum
- Pots in primary vacuum
break the vacuum to remove the pots
- Associate local services to be removed
- RP issues to be considered
- Removal of TOTEM 147 m station during LS1

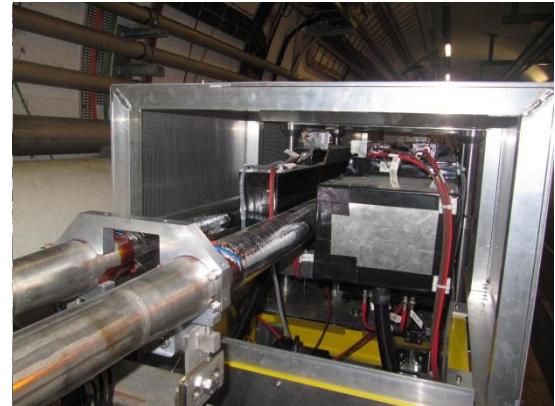

LHC forward detectors – ALICE ZDC

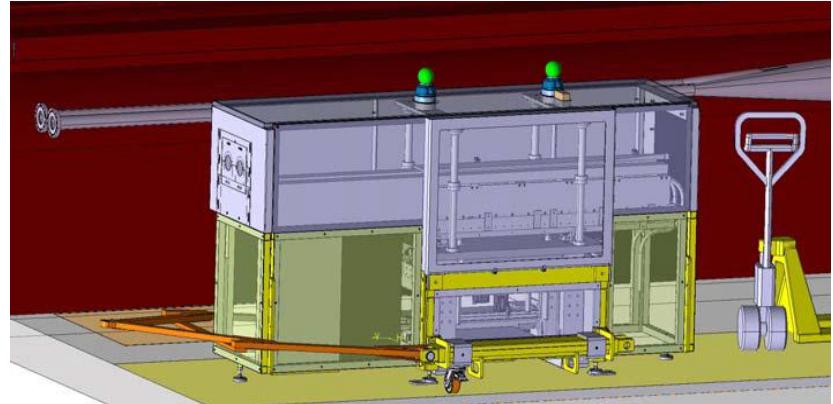

LATEX

Removal procedure

- ZDC detectors installed on a movable platform
- Designed to allow removal without breaking vacuum
- First full temporary removal during LS1

ALICE ZDC platform & detectors

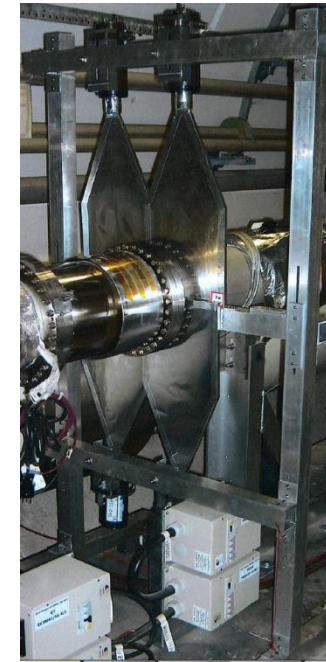

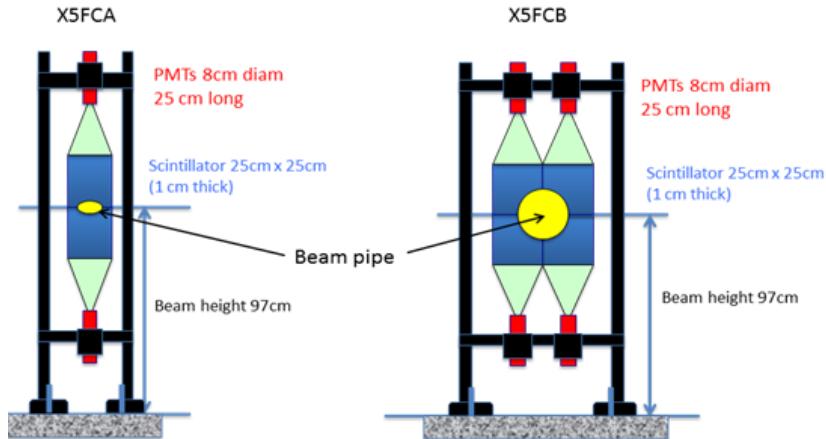

ALICE ZDC platform & detectors

LHC forward detectors – CMS FSC

LTEX

Removal procedure

- Scintillators located around the beam pipe
- No special issues foreseen

CMS FSC station 3

Summary

- TAS, TAN, Forward Detectors in LSS: location at the end of LS1 & technical specificities
- Review the technical issues to remove TAS, TAN, FD
- TAN removal: study group chaired by EN/MEF- EBE since July 2012
- TAS removal: preliminary study by EN/MEF - EBE
- Forward detectors removal: studies by LTEX working group chaired by EN/MEF- LE
