

Online track summary

Vivian O'Dell, Andrew Norman, Tassos Belias,
Niko Neufeld

Statistics

- 53 papers
- 25 posters, 28 – 2 talks (two were victims of the government shutdown)
- Good attendance in the parallel Online sessions

Very high quality throughout
Not mentioned != Not interesting

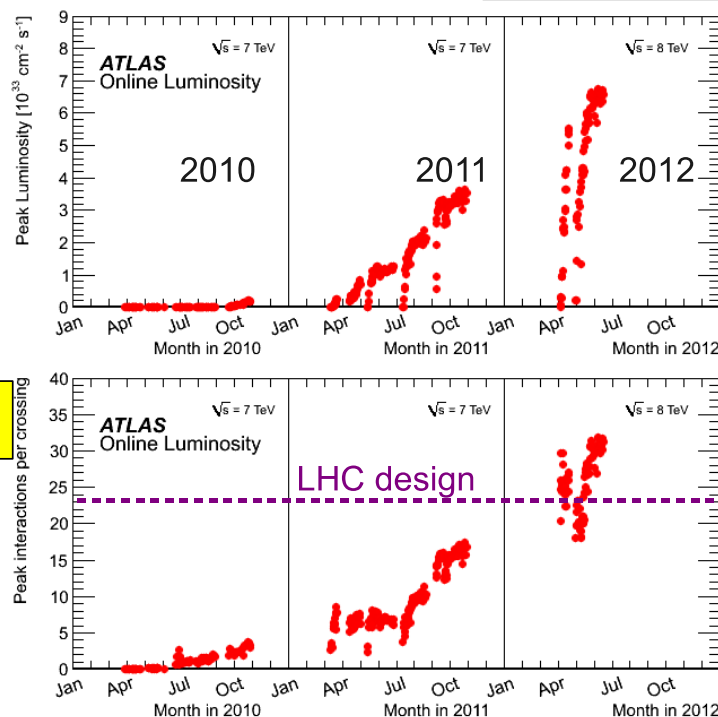

LHC status

- Excellent performance
- Better use of resources

#503 Nagano-san

Peak Luminosity

Peak Interactions per crossing

11 vertices with 1 $Z \rightarrow \mu\mu$

The menu, please!

Trigger, Menu, Strategy, and, EvoluAon,

- ✎ Chain: one full L1 \rightarrow L2 \rightarrow EF selection sequence
 - E.g.: “e24i” chain = single electron trigger with $E_T > 24$ GeV
- ✎ Menu: full set of chains and prescale factors
 - Prescale factor = reduction factor to issue a trigger
 - A typical menu contains ~ 500 chains, to meet a large variety of physics goals at LHC, and also to contain sufficient supporting triggers (for background estimations, detector performances etc.)

Electron chain

- ✂ For 2011-12: managed to run with just 3 base menus for p-p
 - Some chains designed as extras in each menu dropped as luminosity increases to keep bandwidth under control
 - Avoid complication in physics analyses due to frequent trigger changes

**Keep it simple,
not stupid**

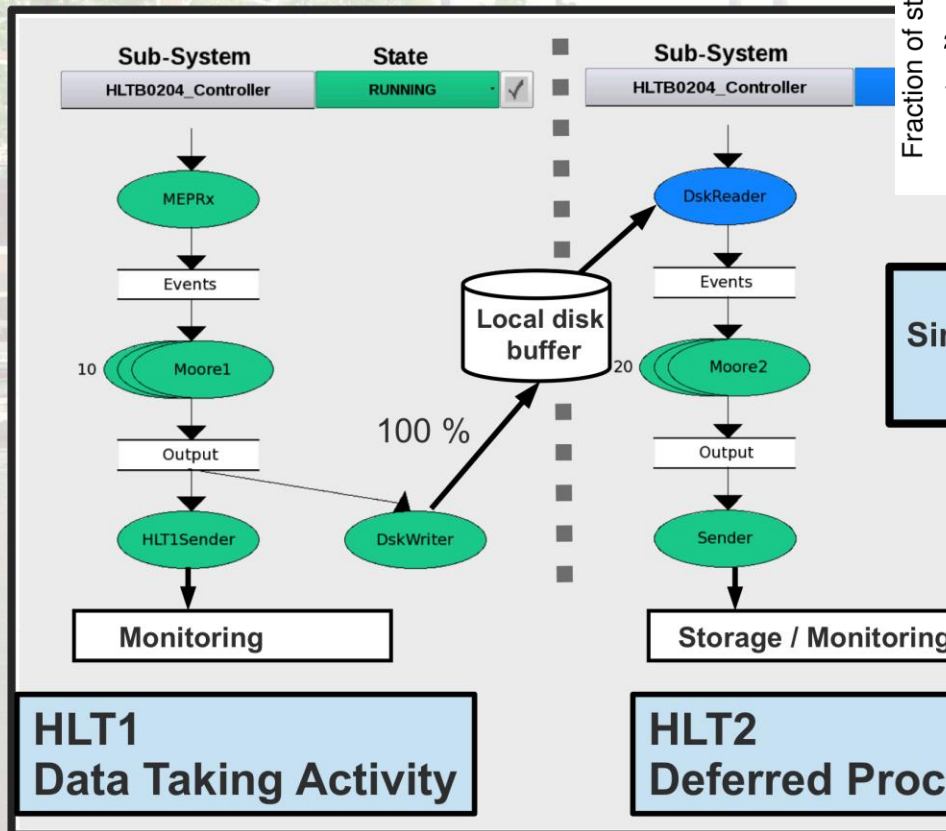

5

Towards 100% efficiency

The Process Architecture: Worker Nodes

Single Worker Node

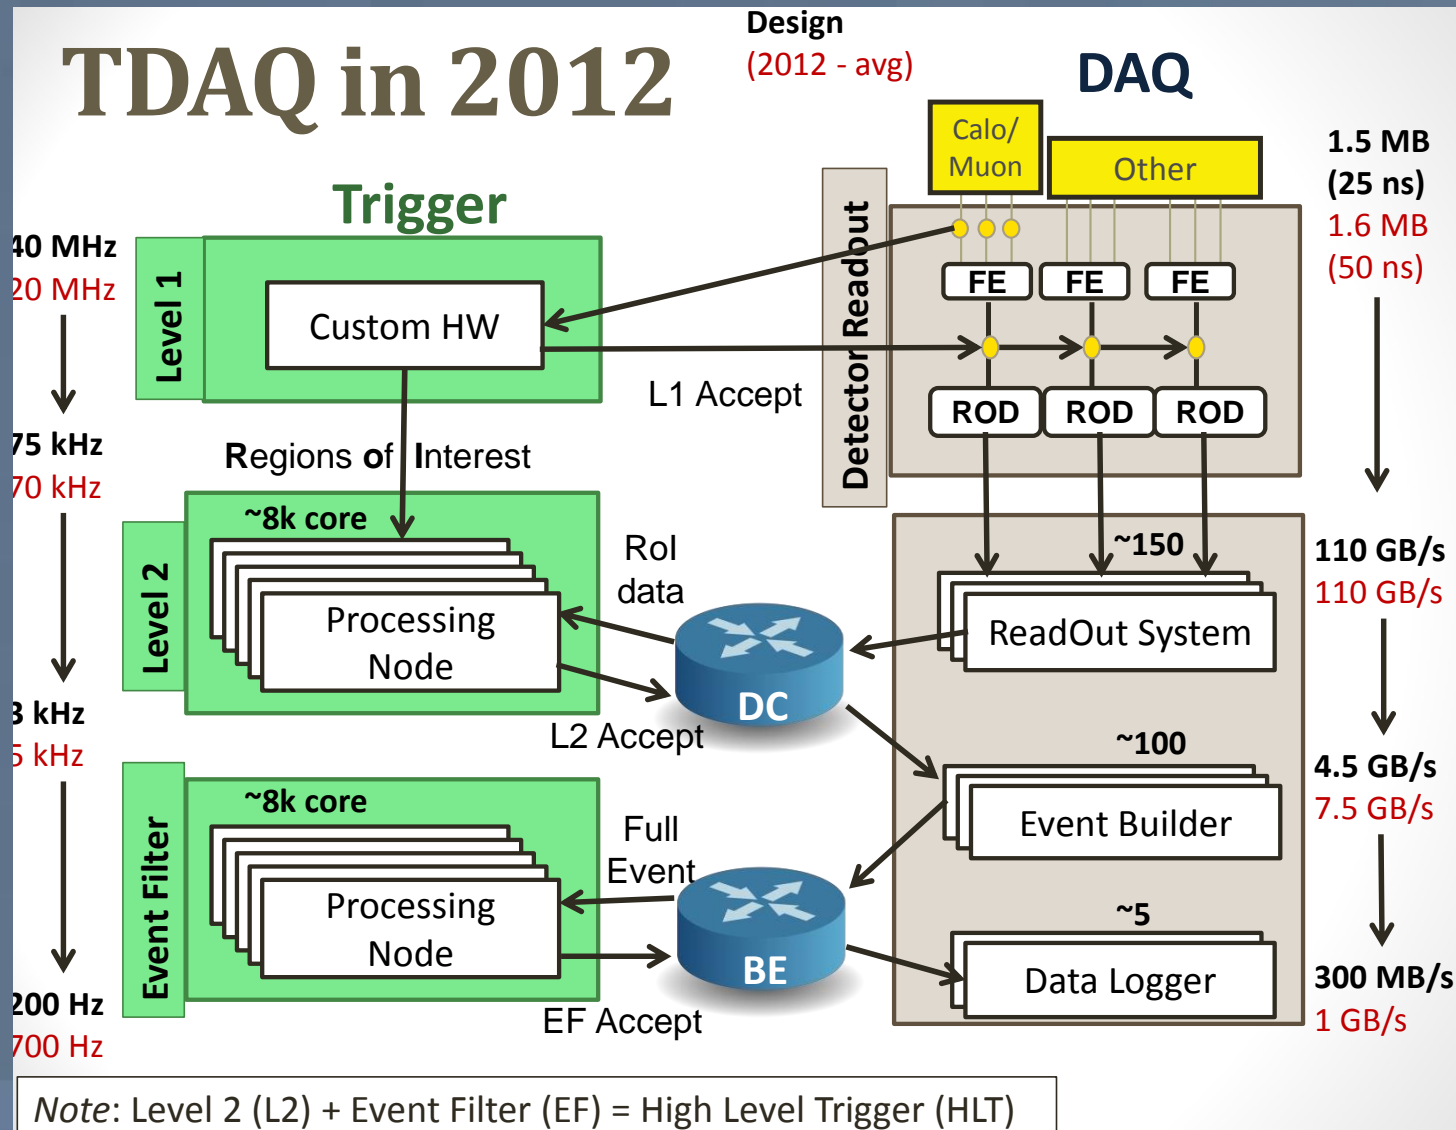

#35
M. Frank

October 15th 2013

Markus Frank CERN/LHCb CHEP2013, Amsterdam, October 14th–18th 2013

7

ATLAS before ... (run 1)

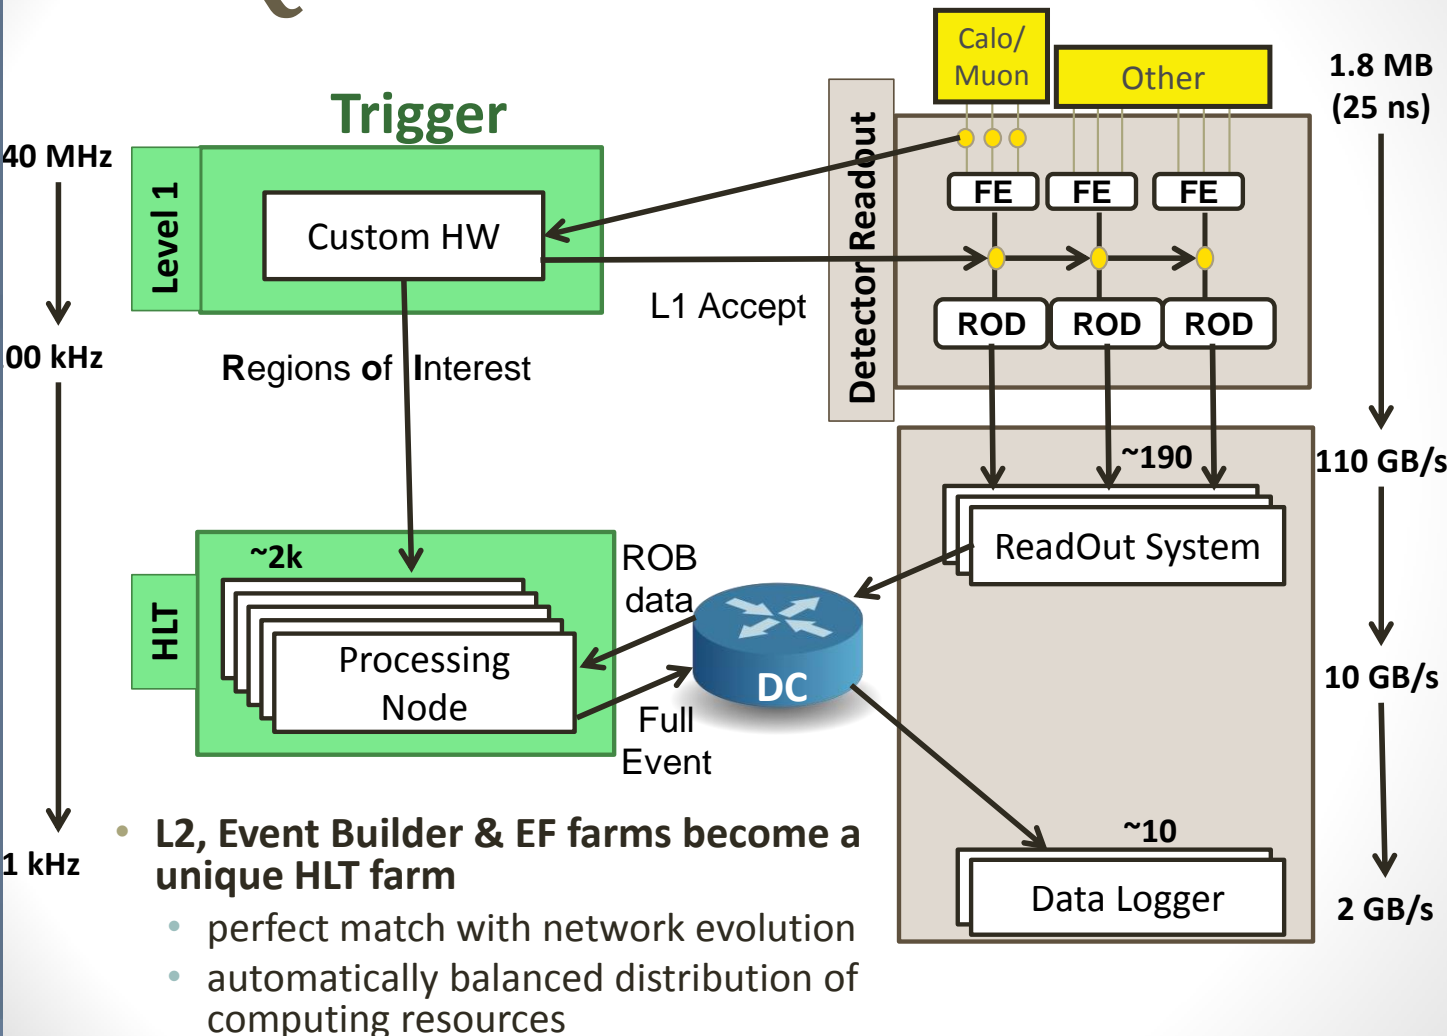

N. Garelli (SLAC) - CHEP2013 17/10/2013

3

and after ... (run 2)

TDAQ After LS1

- More powerful networks and servers lead to simplified architectures
- Improved HLT software (fork-ing) mitigates memory pressure

LHC future

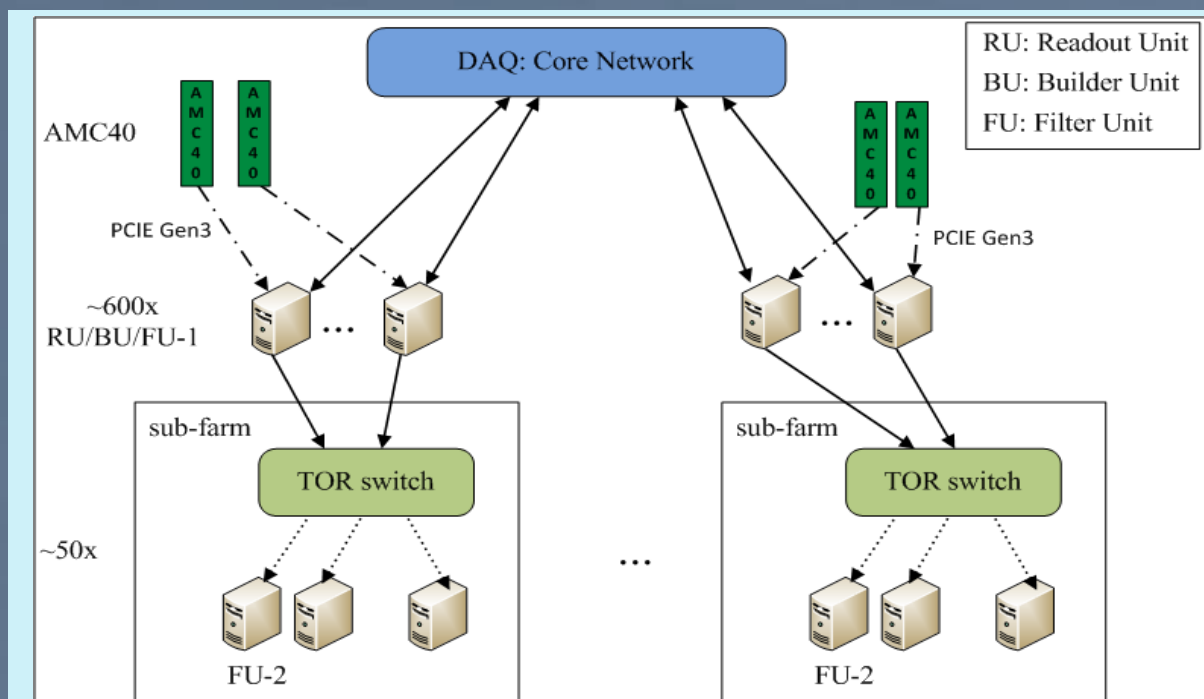

- LHC future is
 - immediate (Run 2)
 - soon (Run 3) → ALICE and LHCb go triggerless
 - coming (Run 4) → HL-LHC (upgrades for ATLAS and CMS) (no talks on this ... yet – current work focusing on FE-electronics)

More and more bytes / second

- “Low-cost” 32 Tbit/s DAQ
- Based on InfiniBand & Ethernet
- FPGA receiver cards in standard server PCs

#54 G. Liu

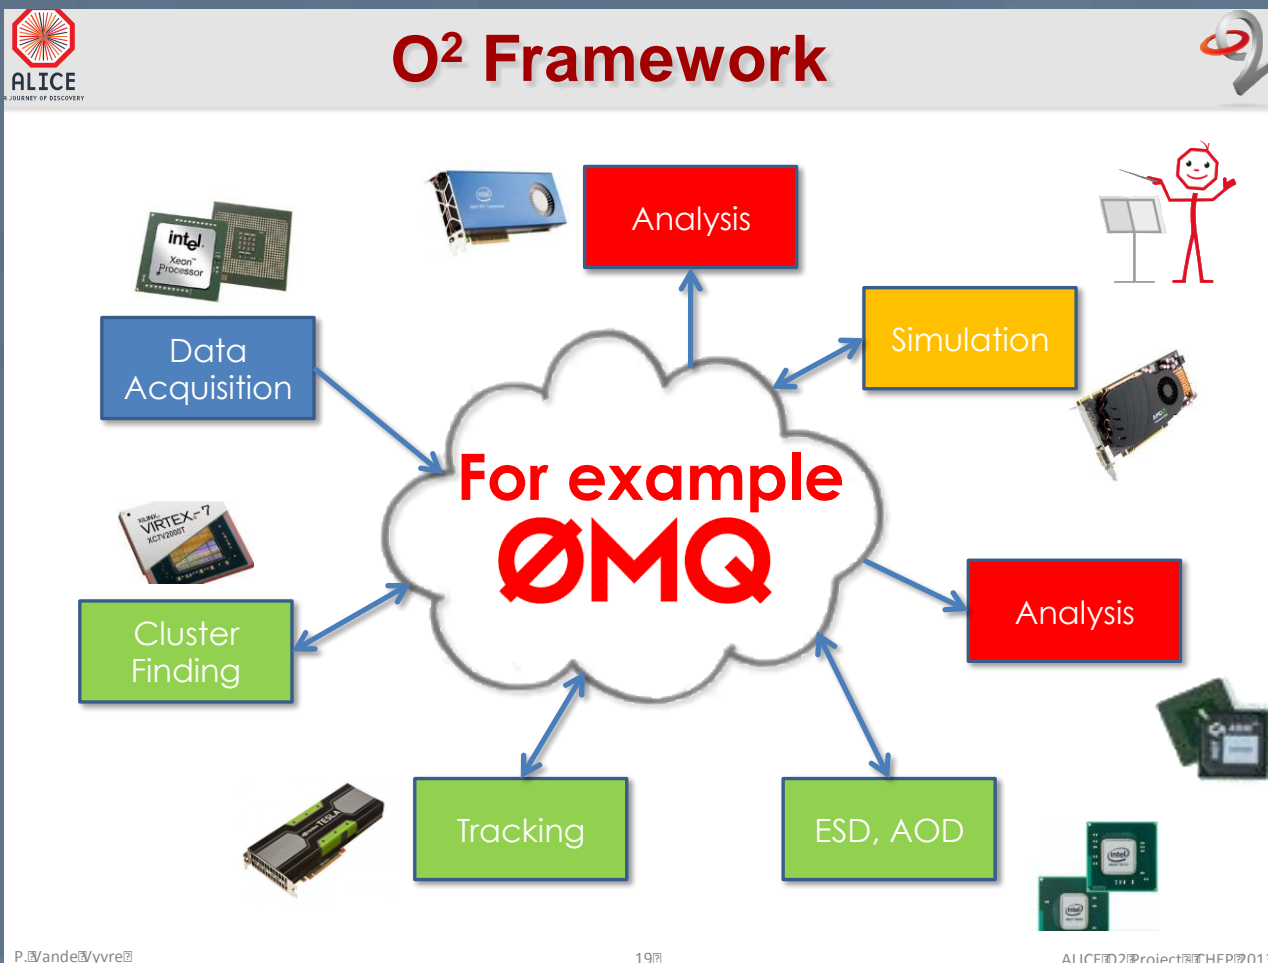

O2: ALICE after LS2

- Continuous readout of the TPC
- Event-building based on time-slices

Detector	Input to Online System (GByte/s)	Peak Output to Local Data Storage (GByte/s)	Avg. Output to Computing Center (GByte/s)
TPC	1000	50.0	8.0
TRD	81.5	10.0	1.6
ITS	40	10.0	1.6
Others	25	12.5	2.0
Total	1146.5	82.5	13.2

Full Online/Offline integration

- Online resources very important
- Increase duty cycle (c.f. also LHCb deferral, similar initiatives in CMS, ATLAS)

Technologies old and new

- FPGAs
- GPGPUs
- Xeon/Phi

Industry standards on FPGA

FEROL Introduction

- **Front-End Readout Optical Link (FEROL)**

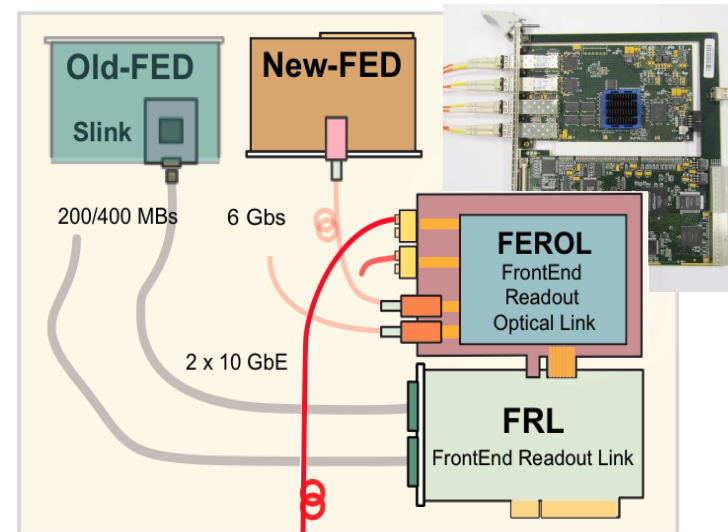

- Interface between custom and commercial hardware/network
- Replace Myrinet NIC with custom FPGA based NIC card

- **Input:**

- Legacy S-link input via FRL
- SlinkXpress interface
 - 2x optical 6 Gbit/s interface
 - 1x optical 10 Gbit/s interface

- **Output:**

- Optical 10 Gbit/s Ethernet link
- Optional second 10 Gbit/s Ethernet link
- Runs a **standard protocol: TCP/IP** over 10Gbit/s Ethernet

#87
P. Zejdl

Ethernet, PCs – with FPGA support

#7 P. Gros 10-GigE for ATLAS Calo RO

A. Gianoli #33

Track#1 (Online)

LOTS: how to do it?

- use **high performance PC** to **run selection algorithm**
- use **fpga board** to **handle fixed delay output** to TTC (needs real-time)
- **avoid memory-to-memory copy**: use **fpga board** to **collect primitives** (udp packets) and put them into **PC ram**

HW used:

- core i7 920 2.67 GHz
- core i7 3930K 3.2 GHz
- Terasic DE4-230 board (Altera StratixIV, PCIe Gen2 x8, 4 eth ports)

GPGPUs in L0, L1, L2, L3, ...

#48 R. Ammendola

“How to get the data in/out quickly

also

#297 GPU Enhancement of the High Level Trigger to extend the Physics Reach at the LHC, H. Valerie

Many-core tracking (CDF example)

SpeedUp vs CPU E5630 time

Breakdown of computing time

Unpack input data and fill arrays
Calculate all hits combinations
Track fitting
Offload (MIC only)
CPU i7-3770

MIC 5110P

Where is most of the time spent on each device?

Standard CPU: most of the time spent in the fitting part; code completely serial → percentage of time flat as # evts increases

MIC: combinations and fitting part take the same time for high number of events.

GPU: the fitting stage dominates for high multiplicity of tracks.

Gtx Titan

SVT track fitting algorithm step by step

Unpack input data (24-bit words) and fill all the necessary arrays.

For each event and for each road, calculate all the possible combinations (each layer can have more than one hit)

For each combination:

- retrieve fit constants from device memory
- perform scalar product and chi2 cut
- format good tracks for output

#78 S. Amerio

#430 A. Lonardo

Total latency of the GPU-Based RICH L0-TP using NaNet-1 (1)

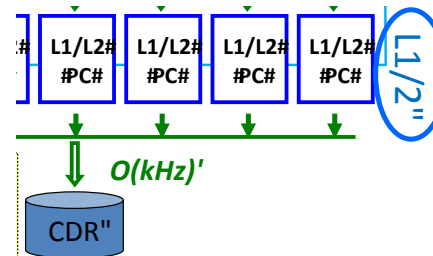

Communication and Kernel Calculation Latencies

Using GPUs in the NA62 L0 Trigger

	TESLA K10*	TESLA K20	TESLA K20X
Peak double precision floating point performance (board)	0.19 teraflops	1.17 teraflops	1.31 teraflops
Peak single precision floating point performance (board)	4.58 teraflops	3.52 teraflops	3.95 teraflops
GK104s	1 x GK110		
1536	2496	2688	
B	5 GB	6 GB

smic, image, signal ccessing, video analytics	CFD, CAE, financial computing, computational chemistry and physics, data analytics, satellite imaging, weather modeling		
X	SMX, Dynamic Parallelism, Hyper-Q		
vers only	Servers and Workstations	Servers only	

Replace custom hardware with GPU based system performing the same task but:

- Programmable
- Upgradable
- Scalable
- Cost effective
- Exploit GPUs computing power to implement more selective trigger algorithms.

The topic of this talk.

Controls (run & slow)

- Controls crucial for success of experiments
- Raw “size” requirements not growing as fast as in DAQ systems, BUT
 - 24/7/365 (often)
 - crucial for overall expt. efficiency
 - large, sophisticated software systems

Controls for Telescopes

The Array control challenge

- 
- CTA will be an open astronomical observatory:
 - Announcements of opportunities
 - Proposal-driven operation
 - Professional operators
 - Diverse operation modes:
 - Pointed observations
 - Scans
 - Sub-Arrays
 - Targets of opportunity
 - Multi-wavelength campaigns
 - Alerts from/to other observatories
 - Pseudo real-time analysis
 - Select and time-tag stereoscopic showers at high efficiency while suppressing background.
 - Read-out and store all the information needed for offline reconstruction.
 - Support diverse operation modes
 - Ensure optimal use of available observation time
 - Handle hardware and software failures in a flexible and smart way

#21 I. Oya

The LHCb Silicon Tracker: Control system specific tools and challenges

Sandra Saerri Garmara (Universität Zürich) on behalf of LHCb Silicon Tracker collaboration

The LHCb Silicon Tracker

The LHCb Silicon Tracker is part of the LHCb tracking system and provides data in the region of high track densities. For the tracking station in front of the detector magnet (TT), the Silicon Tracker covers the full angular acceptance of the experiment, while for the station TT2 after the magnet, the Silicon Tracker (TT2) only covers the region directly around the beam pipe. The detector also monitors the performance of the silicon detectors, which is essential for the data quality. The Silicon Tracker is located in the detector area, and it is designed to be as compact as possible. The Silicon Tracker is designed to be as compact as possible. The Silicon Tracker is designed to be as compact as possible.

Control system specific tools and challenges

The LHCb Silicon Tracker is part of the LHCb tracking system and provides data in the region of high track densities. For the tracking station in front of the detector magnet (TT), the Silicon Tracker covers the full angular acceptance of the experiment, while for the station TT2 after the magnet, the Silicon Tracker (TT2) only covers the region directly around the beam pipe. The detector also monitors the performance of the silicon detectors, which is essential for the data quality. The Silicon Tracker is located in the detector area, and it is designed to be as compact as possible. The Silicon Tracker is designed to be as compact as possible. The Silicon Tracker is designed to be as compact as possible.

Detector Safety FSM

The Detector Safety FSM (FSM) is implemented using a Finite State Machine (FSM) where the detector logic depends on the state of the system. The TT and TT2 require some additional features in terms of operation and monitoring as the silicon sensor has to be cooled at all times. Both sub-detectors use similar techniques and the LHCb controllers are designed to manage these operations. The LHCb controllers are designed to manage these operations. The LHCb controllers are designed to manage these operations.

Detector Specific Tools

The Detector Specific Tools (DST) are implemented using a Finite State Machine (FSM) where the detector logic depends on the state of the system. The TT and TT2 require some additional features in terms of operation and monitoring as the silicon sensor has to be cooled at all times. Both sub-detectors use similar techniques and the LHCb controllers are designed to manage these operations. The LHCb controllers are designed to manage these operations. The LHCb controllers are designed to manage these operations.

Expériment Control System LHC long shutdown consolidation

The Expériment Control System LHC long shutdown consolidation (LHCb) is implemented using a Finite State Machine (FSM) where the detector logic depends on the state of the system. The TT and TT2 require some additional features in terms of operation and monitoring as the silicon sensor has to be cooled at all times. Both sub-detectors use similar techniques and the LHCb controllers are designed to manage these operations. The LHCb controllers are designed to manage these operations. The LHCb controllers are designed to manage these operations.

DAQ around the world

- Accelerator based experiments

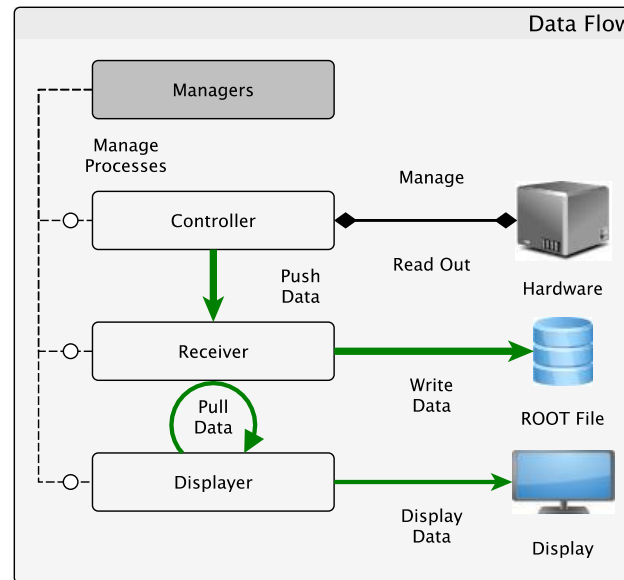

- Belle
- Nova
- MICE
- Panda

- Astronomy

- CTA
- H.E.S.S
- Icecube

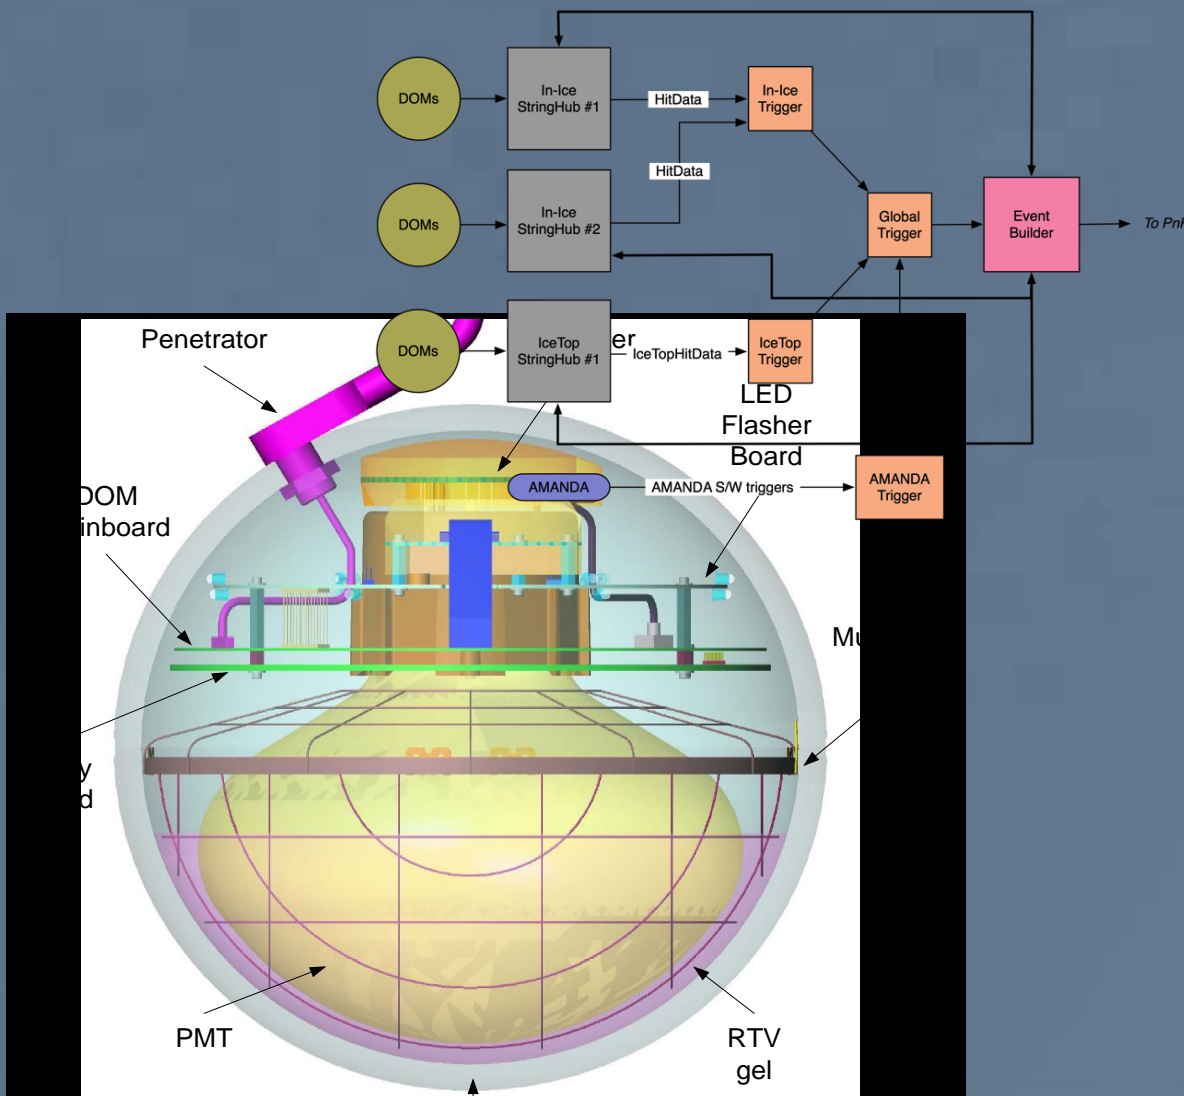

Data Flow

- > Own Receiver for each hardware Controller
- > Every Receiver may have a Displayer
- > Data storage classes are experiment specific
- > Data is stored using [ROOT](#) object serialization mechanism
- > Data calibration and reconstruction algorithms can be used online and offline

- Have to serve multiple “experiments” → flexibility
- > 240 processes for calibration, control, configuration, alarms, etc...
- Using CORBA, C++ and python
- Very high efficiency >99%(!)

IceCube: DAQ @ -40 °C

DOMs triggering on average 500 Hz in ice and 2 kHz IceTop → **3 MHz** aggregate hit rate.

LC tagged hits sent to triggers in-ice triggers select hit clusters: only these sent to triggers currently : approx **50 kHz rate**.

Global Trigger Rate 8 kHz but many overlapping triggers which get merged down to ultimate rate of triggers to Event Builder of **2.7 kHz**.

Event Builder requests data in ± 10 μ s windows (typ. ... up to 10 ms in extreme cases); resultant data rate to disk is **10 MB/sec**.

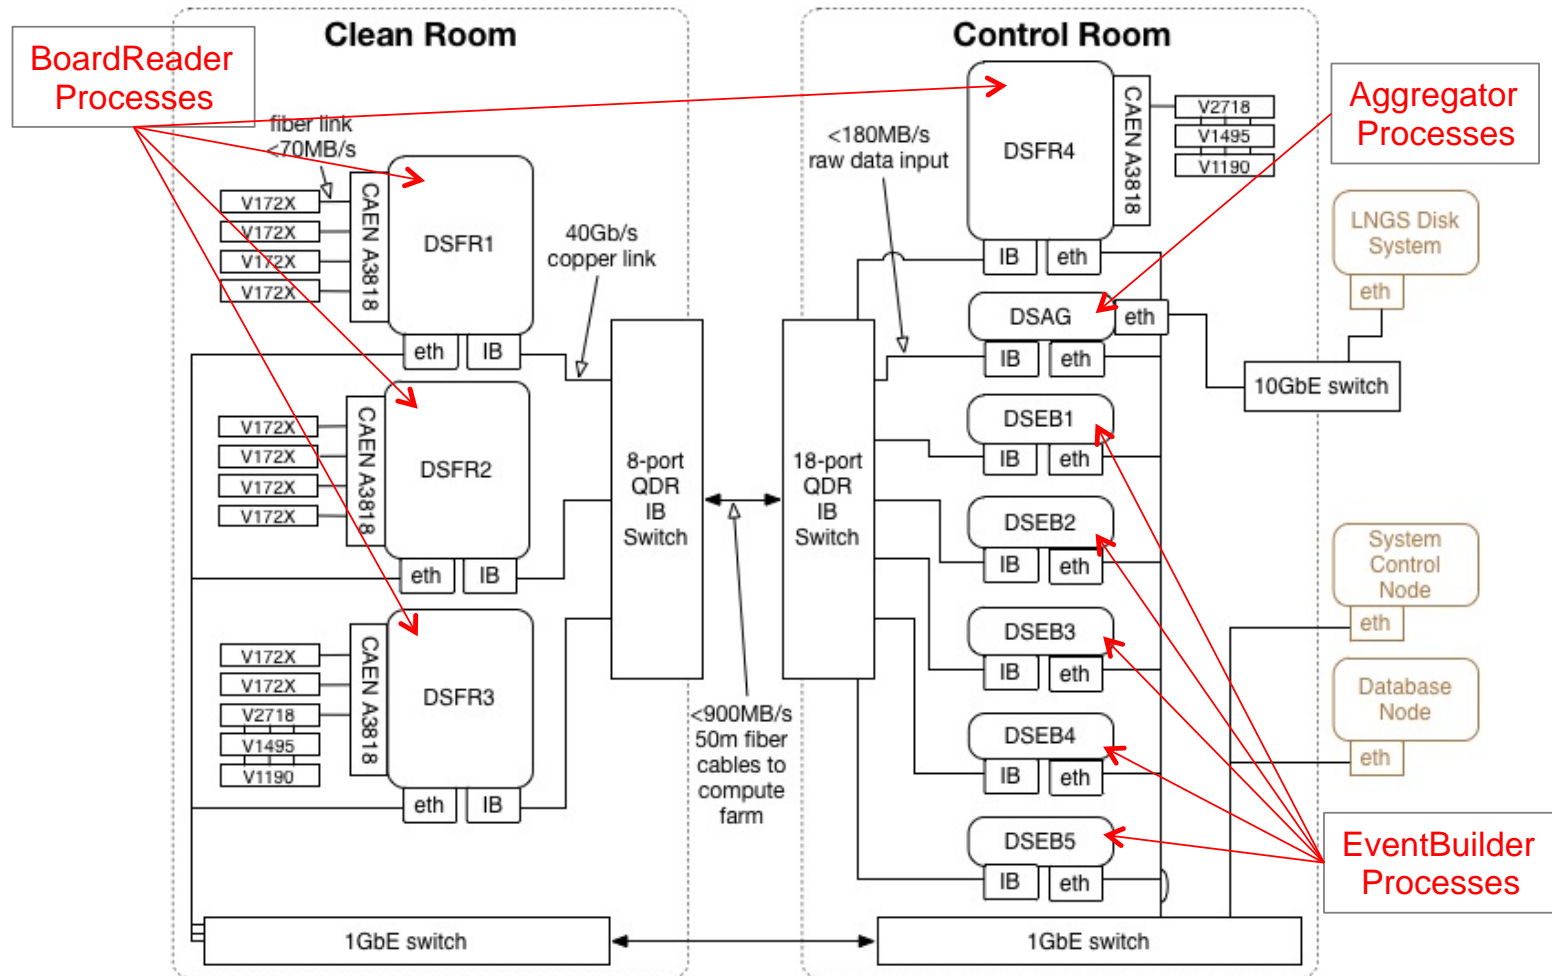

HitSpooling (not shown) all hits from 1st stage (DOM triggers) written to disk buffer on hubs at (aggregate) rate of **250 MB/sec**. Stored in circular buffer for several hours. Useful for external triggers such as SNAQA and GRBs.

#390 K. Haenson

Track#1 (Online) Summary CHEP2013 – N. Neufeld

Ethernet/IB and a modern DAQ framework

artdaq for DarkSide-50

Time Synchronisation: NOVA

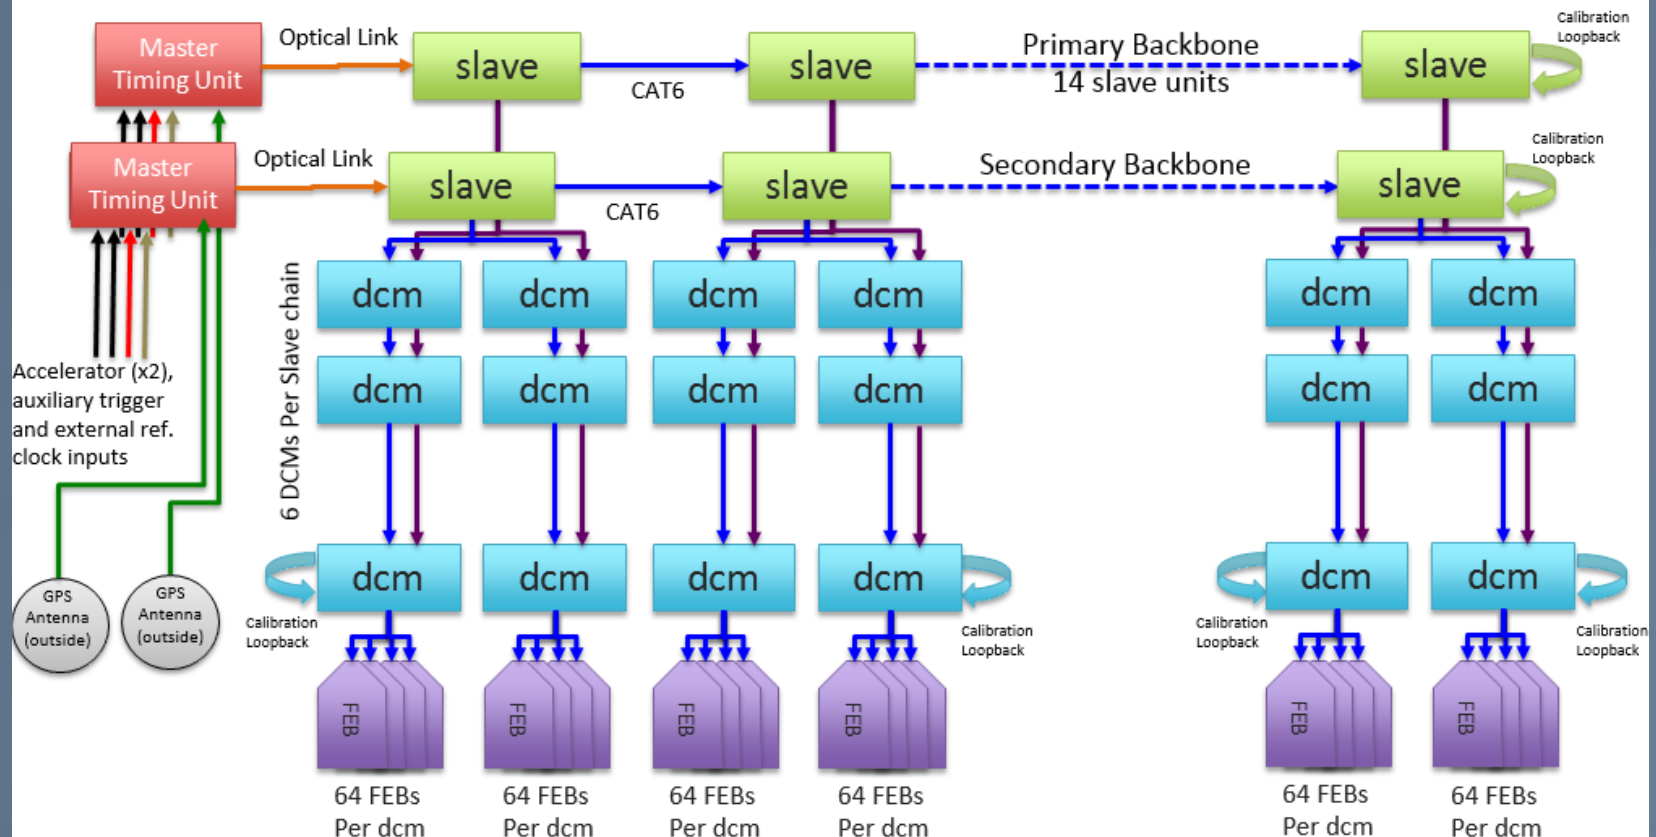

- Need to sync 350k channels with 10 ns precision
- Do not know exact arrival time of spill
- Every channel has a TDC
- Distributed time from GPS
- Continuous read-out with high precision time-stamp 56/64 bits
- Pure software trigger

GPS distributed timing

NOvA Timing Chain

Schematic is for Far Detector layout, Near Detector is a scaled down version

Resisting NIH

Software technologies for CTA

ACS: ALMA Common Software

- Framework for distributed applications used for the control of the ALMA array, one of the largest astronomical projects, similar in many aspects to CTA
- C++, Java and Python implementations
- Framework for a distributed system
- Environment for implementing CORBA applications
- Uses Container/Component Model

DevIO: is an ACS simple and generic abstraction of hardware monitor and control point, based on the Bridge design pattern.

The readout and control system of the MST prototype I. Oya et al.

8

OPC UA: OPC Unified Architecture

- Open Platform Communications specification from the OPC Foundation
- A cross-platform service-oriented architecture for process control
- Multi-platform implementation, including portable ANSI C, C++, C#, Java and .NET implementations
- High scalability: from smart sensors and actuators to mainframes and servers on embedded systems

Re-use and adapt existing controls framework

Use open standards (OPC UA, Java, Ethernet)

Away with the trigger!

Trigger-less PANDA

7

Radosław Karabowicz

An Event Building scenario in trigger-less PANDA experiment

CHEP 2013

- 20 MHz event rate (peaking at 50 MHz).
- Strong event overlap.
- Lack of simple features distinguishing the interesting events from the background.

Physics Book criteria for triggering of:

• J/psi (→ base for many charmonia)

- Invariant Mass: **Tracking/Momentum**
- Electron ID: **Tracking**, cluster energy, track/cluster match
- Muon ID: **Tracking**, Muon detector information
- Vertex: **Tracking**

• D/Ds Mesons

- Pions: **EMC clusters**
- Inv. Mass: **Tracking**
- Kaon, Pion ID: **dE/dx**, **DIRC** info (w/ track match), **ToF** (track match)
- Vertex: **Tracking**

• Baryons

- Inv. Mass: **Tracking**
- proton, pion ID: **DIRC** info (w/ track match)
- Vertex: **Tracking**

- No hardware trigger possible.
- Full event reconstruction, with track finding & fitting, as well as particle identification, needed to extract interesting events.

BELLE2 – Trigger & DAQ at 10^{35} (!!)

Vital statistics at the design luminosity
of $L = 8 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$

- ✓ Beam collision frequency $\sim 508 \text{ MHz}$
 \Rightarrow bunch separation $\sim 2 \text{ ns}$
- ✓ Separation between physics events ~ 25000 bunches
 $\sim 50 \mu\text{s}$
- ✓ Good physics rate $\sim 20 \text{ kHz}$ (see next slide)
- ✓ L1 trigger peak rate $\sim 30\text{kHz}$ (not much junk!)
- ✓ L1 latency = $5 \mu\text{s}$
- ✓ Minimum time between triggers $\sim 2 \text{ ns}$
- ✓ Data reduction: $80 \text{ TByte/s} \rightarrow 60 \text{ GByte/s}$
- ✓ L1 efficiency for $\Upsilon(4S)$ events $\sim 100\%$

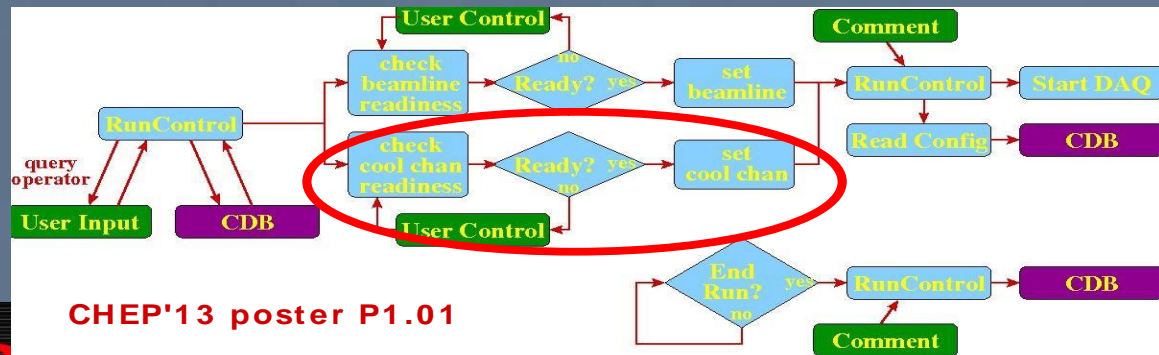

KLM trigger in Belle2 → using a common module

Barrel K_L -Muon (KLM) data flow for RPCs

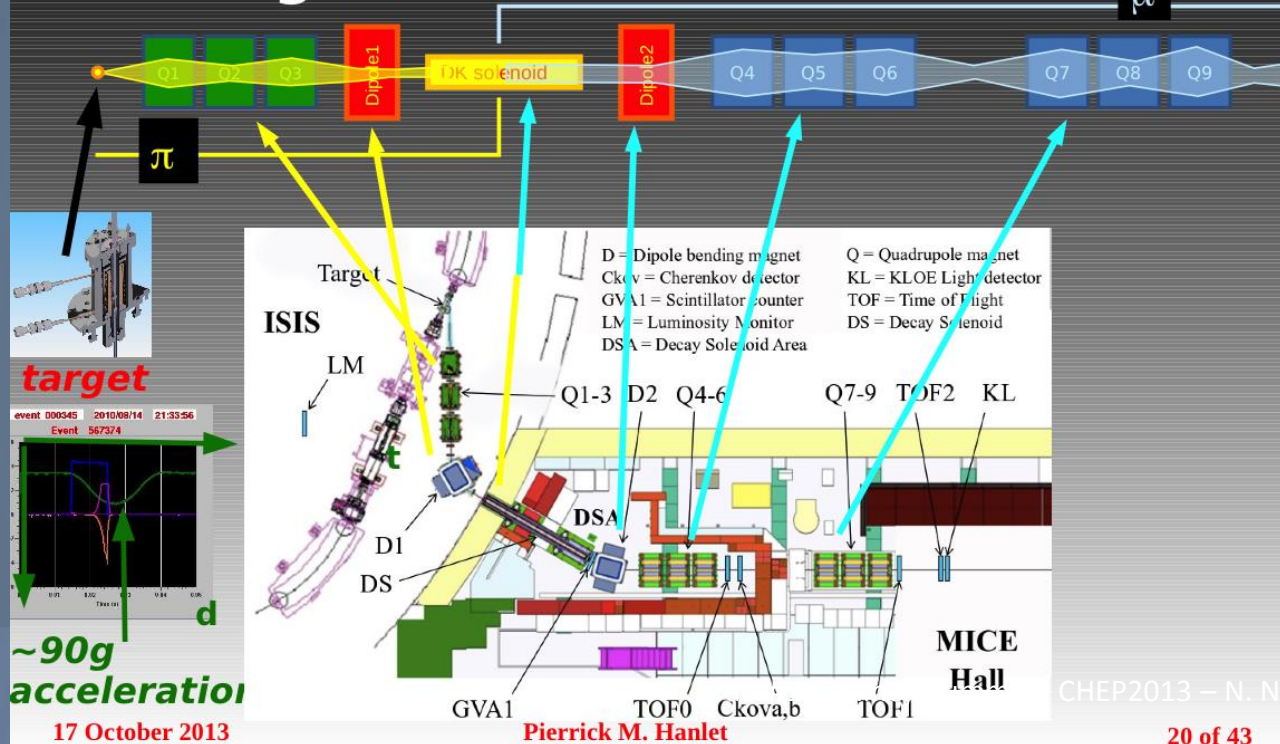

MICE → towards the far future

#447 P. Hanlet

μ Beam Creation

Selecting a muon beam

- Precision experiment 0.1%
- Tight integration of machine and experiment devices
- Highly automated control

Summary of Summary

- == input for the Summary of the Summaries
- Trend to use more and more COTS equipment and all-software based solutions continues
- DAQ systems outside HEP have been growing a lot → challenges comparable, similar ideas & synergy coming on
