

Introduction

- Operator screens (HMI) of control systems at CERN need more and more advanced and customized visualizations
- Maintenance of existing visualization plugins code (C++) and development of new ones requires effort
- We observe a multitude of general-purpose interactive visualizations and widgets on the web
- Growing use of JavaScript as scripting language in many domains (NodeJS, ProcessingJS, Qt Quick,...)

Solution

FwWebViewPlus delivers a generic web-rendering plugin (HTML5, JavaScript), deeply integrated with WinCC-OA

Technologies

- EWO: WinCC-OA's native binary plugin mechanism for User Interfaces, with open C++ API, linked to Qt
- WebKit: widespread open-source web engine
- QWebView/QtWebKit: webkit component of Qt

Approach

- Reuse and integrate existing components
- JS visualizations easier to maintain/create/adapt
- Aim: simplicity for WinCC-OA engineering
- Aim: "drag-and-drop" of prepackaged JS widgets

Hybrid programming:

JavaScript + HTML5 + CTRL

- New widget integration requires some (minimal) interfacing code, typically on both sides
- Added facilities for programmer:
 - making JS method known to CTRL
 - passing JS user events to CTRL
 - converting data types on-the-flight to their native representations

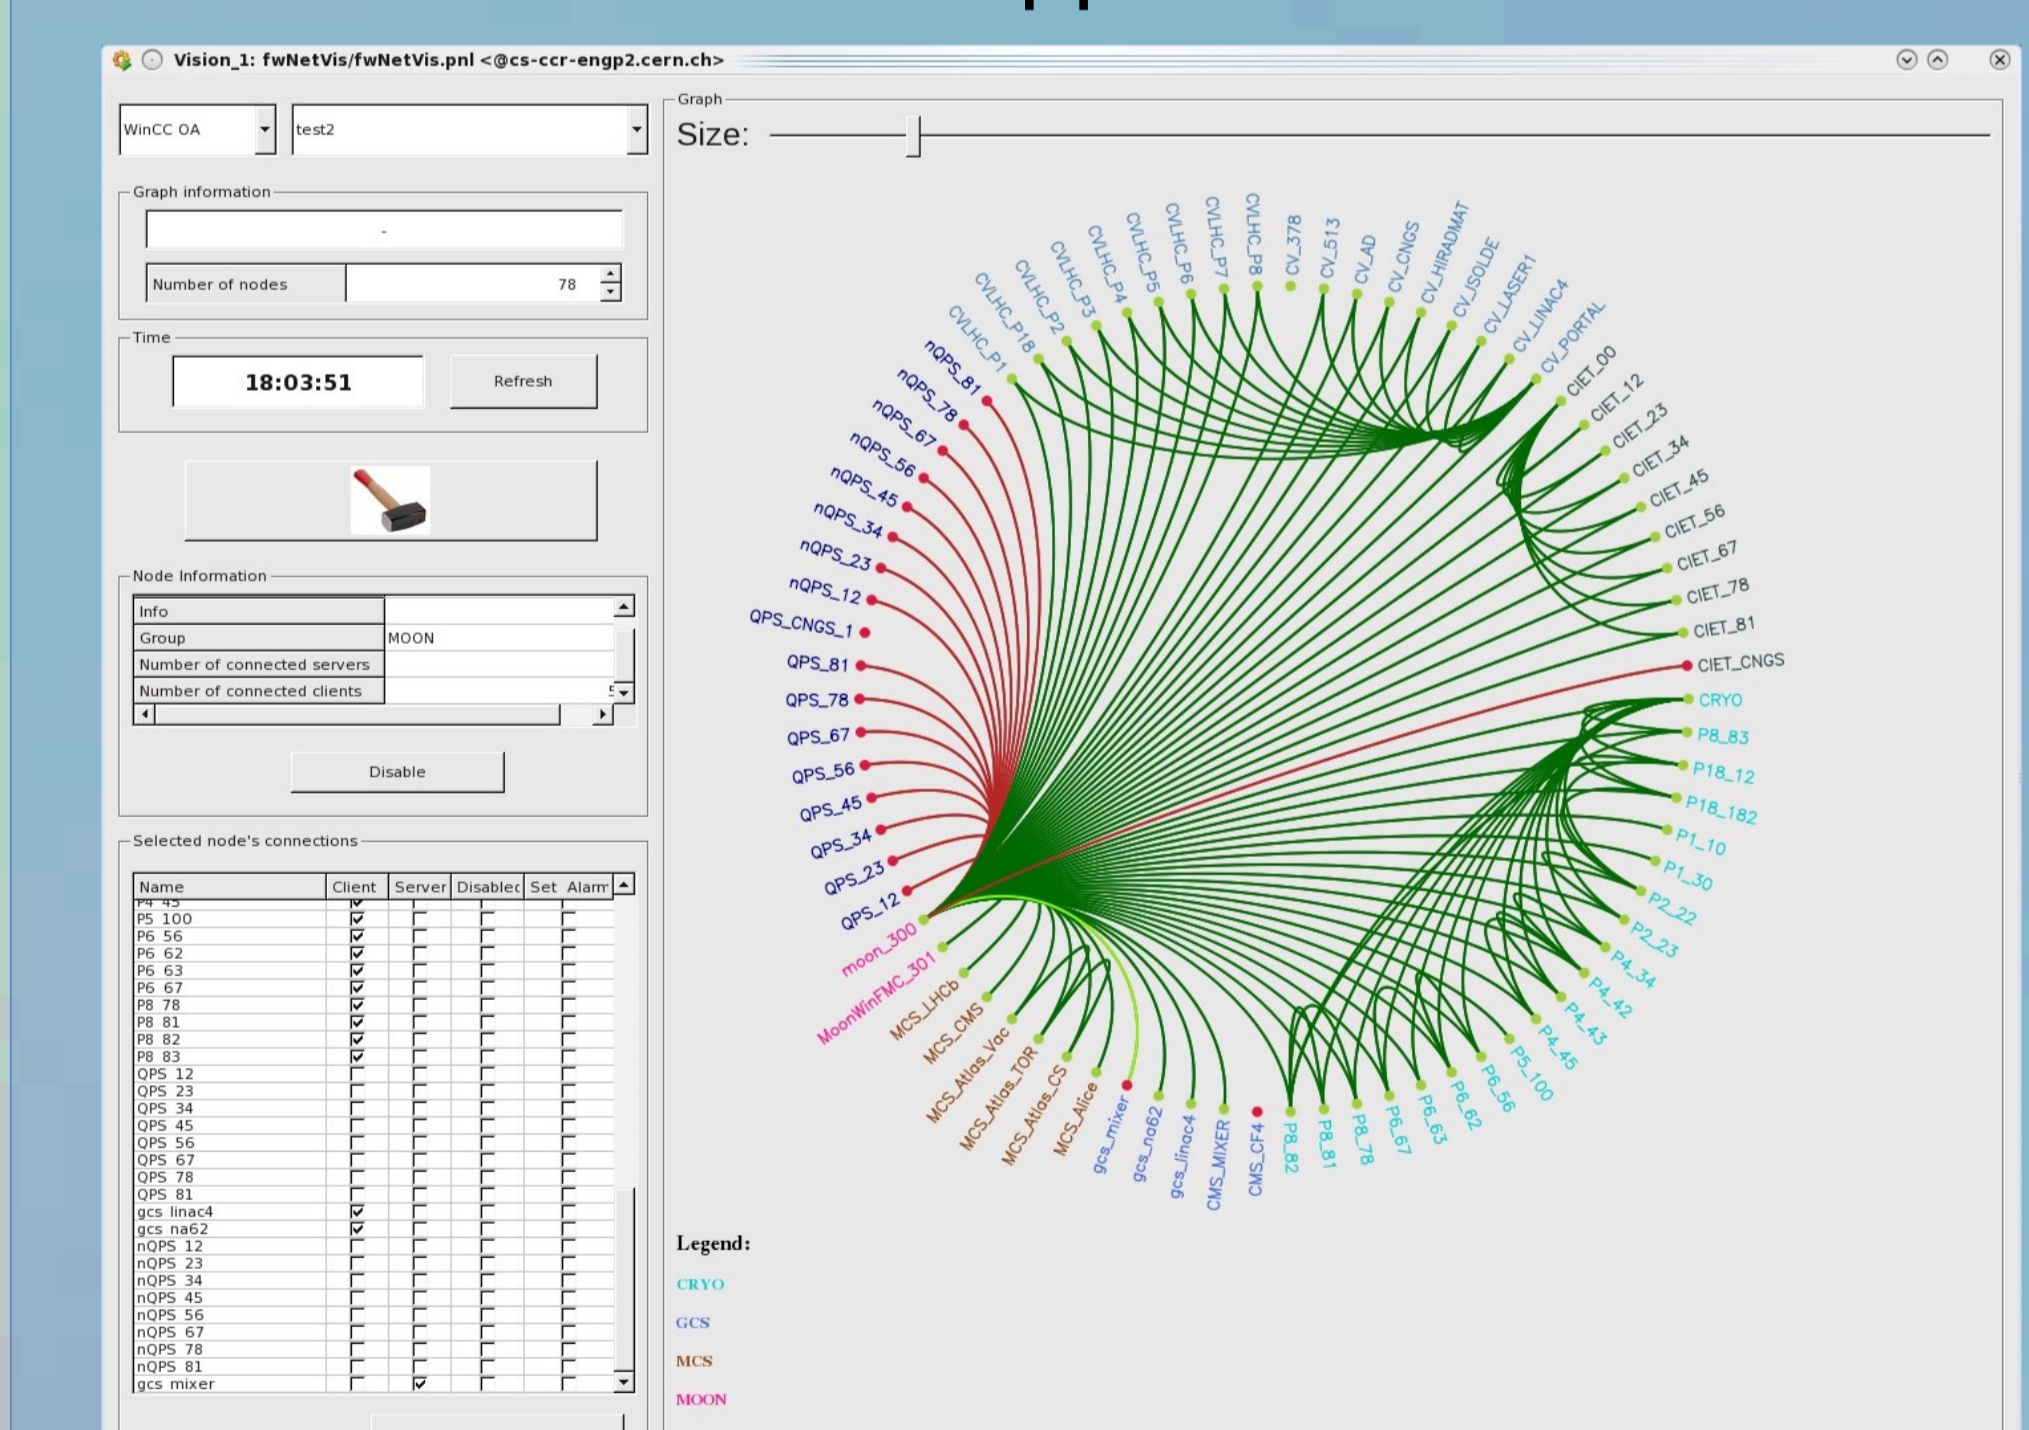

```

<!-- Web Development JavaScript+HTML5 -->
<script>
var dpname = "[datapoint]" val[!*]_online_value;
var result = winCC.dpConnect(dpname, function(name, value) {
  show(result);
});
show(result);
} else {
  $t[!value].text(result.description);
}
</script>
<style type="text/css">
input { width: 100%;
button { width: 100%;
p { line-height: 100%; padding: 0px; margin: 12px 0px 0px;
#value-container { margin: 12px 0px 0px;
</style>
<!-- Content Part -->
<body>
<div value="Inspector Example">
<input type="text" id="datapoint" value="ExampleDP_Result"/>
<button disabled="true" id="connect">Connect</button>
<button disabled="true" id="dpset">DpSet</button>
<div id="value-container">
<div class="displayField" id="value">
<div class="displayField" id="time">
</div>

```

Results

Visualization of connectivity state embeds the MooWheel³ web widget into the fwWebViz application

HeatMap visualization

- Written from scratch in JavaScript and HTML5
- Animated with live data from WinCC-OA
- Interactive (selection of cells)
- Works within fwWebView and equally well in a web browser

Example of simple value-change monitor panel implemented completely with HTML/Javascript (50 lines of code)

Connecting with WinCC-OA data required no code in CTRL!

Value Inspector Example

Type-in datapoint-element Name:
ExampleDP_Result.

Connect

DpSet

52

2013.09.30 11:41:20.190

Conclusion and outlook

- fwWebViewPlus allows to integrate already existing web visualizations and implement new ones with less effort
- The solution is platform-independent, secure and eases the long-term maintenance
- The powerful JavaScript engine of WebKit may be harnessed for data processing by employing projects such as D3.js, or Processing.js
- Enables the use of web-based techniques for HMI development now, to ease the full migration to the web in future
