Working Towards a Boosted Z to bb Measurement with the ATLAS Detector

Tuesday, 9 April 2013 08:45 (12 minutes)

The observation of a Z boson decaying to b quarks at a hadron collider is a difficult measurement to make due to the large QCD background. This talk will show work to develop methods to increase this low signal to background ratio, as part of the ongoing effort to measure the Z to bb signal with the ATLAS detector.
