## Recent developments and phenomenological applications of OpenLoops

*Wednesday 24 April 2013 14:30 (30 minutes)*

### Summary

I will present the latest developments in OpenLoops, a fully general and automatic algorithm to compute one-loop scattering amplitudes. In addition to the most recent technical improvements, I will also discuss the interface of OpenLoops with general purpose event generators, and present some first applications to the phenomenology of the LHC.

**Presenter:** CASCIOLO, Fabio (University of Zurich)
