

Linear collider physics and detector studies for ILC and CLIC

Juan A. Fuster Verdú, IFIC-Valencia

ECFA Plenary Meeting, November 22-23 2012

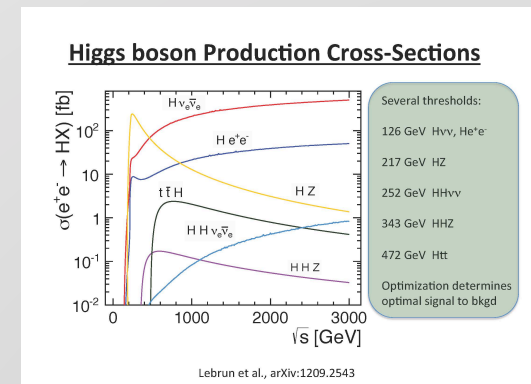

Thanks for providing material:

J. Brau, K. Fuji, C. García, L. Linssen, M. Peskin, G. Rodrigo, J. Wells

-
- Introduction: physics situation and detector challenges for linear colliders
 - ILC detector R&D: status, activities, milestones 2011-2012 (DBD)
 - CLIC detector R&D: status, activities, milestones 2011-2012 (CDR)
 - Linear Colliders workshops in 2012 & future 2013 workshops
 - Summary

Physics at Linear Colliders from 250 GeV to 3000 GeV

- **Physics case for the Linear Collider:**
 - Higgs physics (SM and non-SM)
 - Top
 - SUSY
 - Higgs strong interactions
 - New Z' sector
 - Contact interactions
 - Extra dimensions
 -
- **ILC and CLIC physics case is very similar,**
(energy range and technical readiness are the issue)

^(a)Center for High Energy Physics, University of Oregon, USA; ^(b)Centre for High Energy Physics, Indian Institute of Science, Bangalore, India; ^(c)Laboratoire de l'Accélérateur Linéaire, IN2P3/CNRS et Université Paris-Sud, France; ^(d)Cavendish Laboratory, University of Cambridge, UK; ^(e)Argonne National Laboratory, Argonne, USA; ^(f)DESY, Hamburg, Germany; ^(g)CERN, Geneva, Switzerland; ^(h)Tohoku University, Japan

A joint ILC and CLIC contribution defending the Physics Case of an e^+e^- Linear Collider

Other documents for accelerator, detector, spin-offs and R&D were also presented

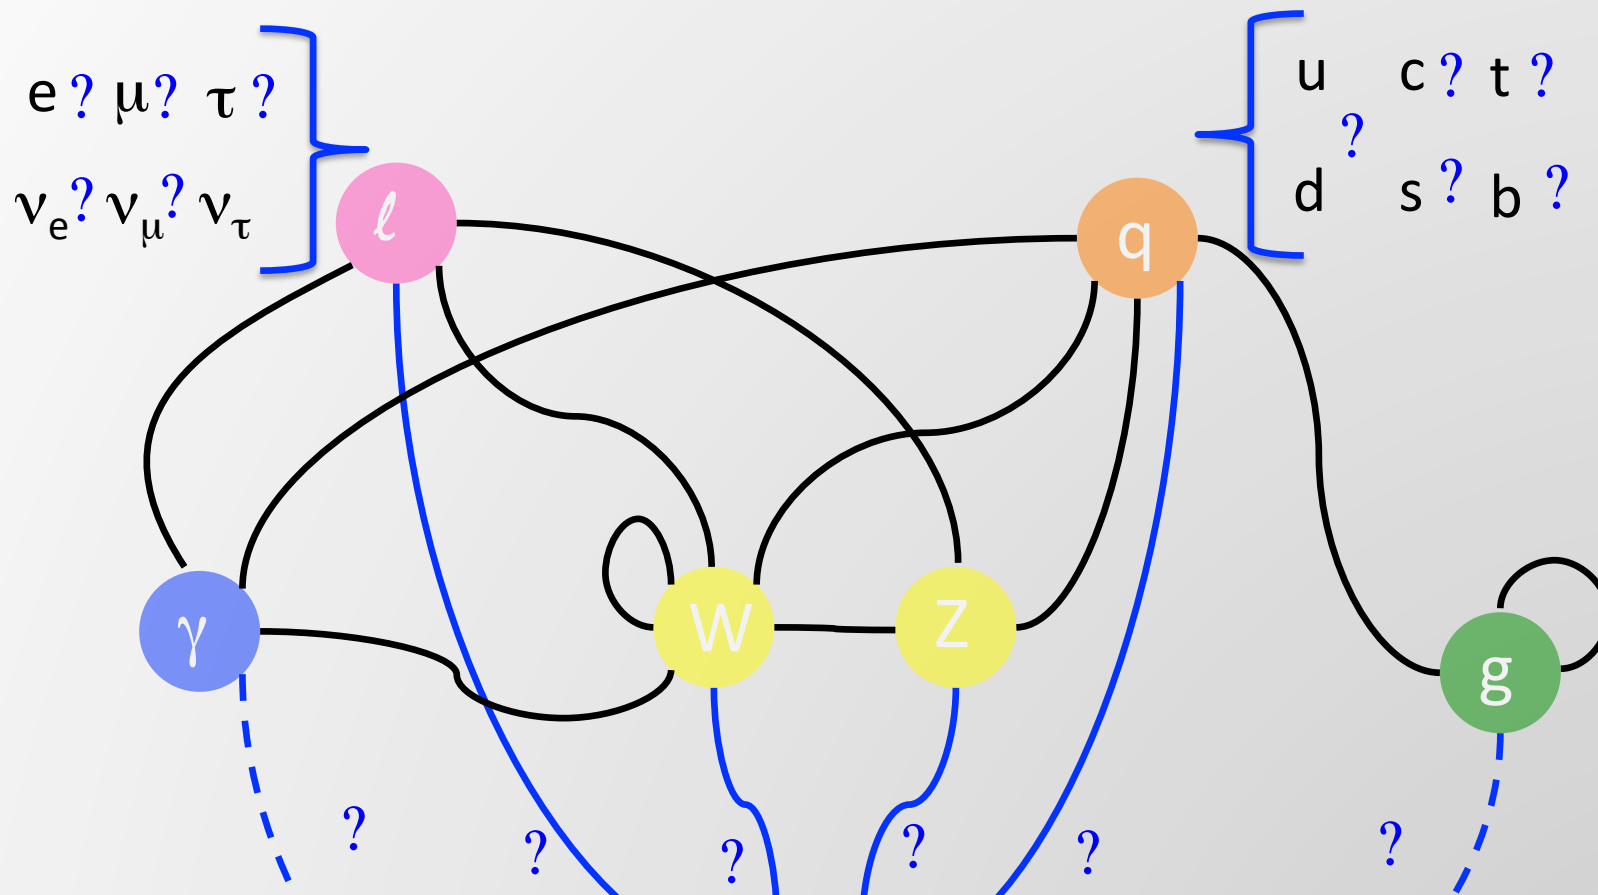

Physics situation before 4th of July 2012

Understanding the (W,Z, γ ,g, leptons, quarks) sector of the Standard Model has implied:

- Continuous development of theory, detector technology and new accelerators in the past decades
- Several accelerators contributing: PEPI, PETRA, TRISTAN, SPS, LEP, SLC, HERA, BEPCII, TEVATRON, CESR, PEPII, KEKB ...
- Combined use of different accelerator natures: $e+e^-$, ep , $p\bar{p}$, and a world-wide effort: in America, Asia and Europe
- Final understanding has required high precision measurements

Now, the Higgs-like boson has been discovered at LHC

Testing the Higgs sector,
a new type of matter and a new interaction,
will require high precision measurements

Physics program, 1st step: “uncover the secret of EWSB” ≤ 0.5 TeV (ILC & CLIC)

ZH @ 250 GeV ($\sim m_Z + m_H + 20$ GeV): 250 fb^{-1} to 500 fb^{-1}

Higgs mass, width, J^{PC}

Gauge quantum numbers

Absolute measurement of HZZ coupling (recoil mass)

BR($h \rightarrow VV, qq, ll, \text{invisible}$): $V=W/Z$ (direct), g, γ (loop)

ttbar @ 340-350 GeV ($\sim 2m_t$): $100\text{-}200 \text{ fb}^{-1}$

ZH meas. Is also possible

Threshold scan \rightarrow indirect meas. of top Yukawa coupling

AFB, Top momentum measurements

Form factor measurements (polarization important)

vvH @ 350 – 500 GeV: 500 fb^{-1}

HWW coupling \rightarrow total width \rightarrow absolute normalization of couplings

ZHH @ 500 GeV ($\sim m_Z + 2m_H + 170$ GeV): 2 ab^{-1}

Prod. cross section attains its maximum at around 500 GeV \rightarrow Higgs self-coupling

ttbarH @ 500 GeV ($\sim 2m_t + m_H + 30$ GeV): 1 ab^{-1}

Prod. cross section becomes maximum at around 700-800 GeV.

QCD threshold correction enhances the cross section \rightarrow top Yukawa measurable to 10% at 500 GeV concurrently with the self-coupling

Physics program, 2nd step: “Higgs study at high energy” 0.5-1.0 TeV (ILC & CLIC)

vvH @ $\sqrt{s} > 1\text{TeV}$: 2ab^{-1} (pol e^+, e^-) = (+0.2, -0.8)

Allows to measure rare decays such as $H \rightarrow \mu^+ \mu^-$, ...

vvHH @ 1TeV or higher: 2ab^{-1} (pol e^+, e^-) = (+0.2, -0.8)

cross section increases with E_{cm} but the sensitivity might not, because of background diagrams.

Nevertheless, $\Delta\lambda/\lambda \sim 20\%$ or better is expected.

If possible, we want to see the running of the self-coupling (very very challenging).

ttbarH @ 1TeV: 1ab^{-1}

Prod. cross section becomes maximum at around 700GeV.

QCD threshold correction enhances the cross section leading to top Yukawa measurable to $\sim 5\%$. This measurement can be performed concurrently with the self-coupling measurement.

For models with extended Higgs sector, *higher energies imply higher mass reach to other Higgses and higher sensitivity to WLWL scattering* to decide whether the Higgs sector is strongly interacting or not

Physics program, 3rd -- 4th step: “Potential for New Physics” 1.0-3.0 TeV (CLIC)

Results of SUSY benchmarks at 1.4 TeV

\sqrt{s} (TeV)	Process	Decay mode	SUSY model	Measured quantity	Unit	Gene- rator value	Stat. error
1.4	Sleptons production	$\tilde{\mu}_R^+ \tilde{\mu}_R^- \rightarrow \mu^+ \mu^- \tilde{\chi}_1^0 \tilde{\chi}_1^0$	III	σ	fb	1.11	2.7%
				$\tilde{\ell}$ mass	GeV	560.8	0.1%
				$\tilde{\chi}_1^0$ mass	GeV	357.8	0.1%
		$\tilde{e}_R^+ \tilde{e}_R^- \rightarrow e^+ e^- \tilde{\chi}_1^0 \tilde{\chi}_1^0$		σ	fb	5.7	1.1%
				$\tilde{\ell}$ mass	GeV	558.1	0.1%
				$\tilde{\chi}_1^0$ mass	GeV	357.1	0.1%
		$\tilde{\nu}_e \tilde{\nu}_e \rightarrow \tilde{\chi}_1^0 \tilde{\chi}_1^0 e^+ e^- W^+ W^-$		σ	fb	5.6	3.6%
				$\tilde{\ell}$ mass	GeV	644.3	2.5%
				$\tilde{\chi}_1^\pm$ mass	GeV	487.6	2.7%
1.4	Stau production	$\tilde{\tau}_1^+ \tilde{\tau}_1^- \rightarrow \tau^+ \tau^- \tilde{\chi}_1^0 \tilde{\chi}_1^0$	III	$\tilde{\tau}_1$ mass	GeV	517	2.0%
				σ	fb	2.4	7.5%
1.4	Chargino production	$\tilde{\chi}_1^+ \tilde{\chi}_1^- \rightarrow \tilde{\chi}_1^0 \tilde{\chi}_1^0 W^+ W^-$	III	$\tilde{\chi}_1^\pm$ mass	GeV	487	0.2%

				$\tilde{\chi}_2^0$ mass	GeV	487	0.1%
1.4	Neutralino production	$\tilde{\chi}_2^0 \tilde{\chi}_2^0 \rightarrow h/Z^0 h/Z^0 \tilde{\chi}_1^0 \tilde{\chi}_1^0$	III	σ	fb	5.4	1.2%

all results
with
 $L \Rightarrow 1.5 \text{ ab}^{-1}$

CLIC CDR
Vol. 3

Higgs boson production event rates

Brau et al., '12

	250 GeV	350 GeV	500 GeV	1 TeV	1.5 TeV	3 TeV
$\sigma(e^+e^- \rightarrow ZH)$	240 fb	129 fb	57 fb	13 fb	6 fb	1 fb
$\sigma(e^+e^- \rightarrow H\nu_e\bar{\nu}_e)$	8 fb	30 fb	75 fb	210 fb	309 fb	484 fb
Int. \mathcal{L}	250 fb ⁻¹	350 fb ⁻¹	500 fb ⁻¹	1000 fb ⁻¹	1500 fb ⁻¹	2000 fb ⁻¹
# ZH events	60,000	45,500	28,500	13,000	7,500	2,000
# $H\nu_e\bar{\nu}_e$ events	2,000	10,500	37,500	210,000	460,000	970,000

Table 1: The leading-order Higgs unpolarised cross sections for the Higgs-strahlung and WW-fusion processes at various centre-of-mass energies for $m_H = 125$ GeV. Also listed is the expected number of events accounting for the anticipated luminosities obtainable within 5 years of initial operation at each energy.

Physics at Linear Colliders: Higgs Boson, invisible decay

Recoil Mass

$$M_X^2 = (p_{CM} - (p_{\mu^+} + p_{\mu^-}))^2$$

Invisible decay detectable!

250 fb^{-1} @250 GeV

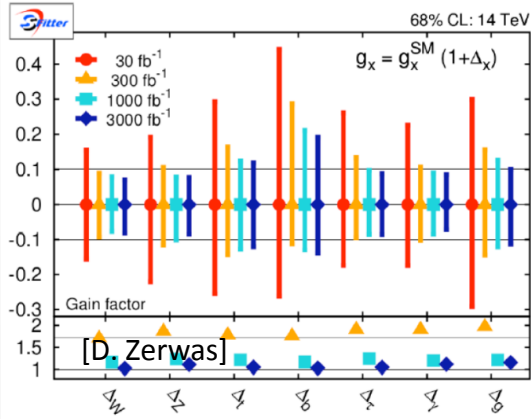

$\Delta\sigma_H/\sigma_H = 2.5\%$

$\Delta m_H = 30 \text{ MeV}$

Model-independent absolute measurement of the HZZ coupling

Physics at Linear Colliders: Higgs Boson, couplings

LHC (30/300/1000/3000 fb⁻¹) LHC (3000 fb⁻¹) ; LC(500GeV/500fb⁻¹) LHC (3000 fb⁻¹);LC(HLC/ILC/ILCTeV)

Mode	BR	σ_{BR}	$\Delta\sigma_{BR}/\sigma_{BR}$	$\Delta BR/BR$
$h \rightarrow bb$	65.7%	232.8	1.0%	2.7%
$h \rightarrow cc$	3.6%	12.7	6.9%	7.3%
$h \rightarrow gg$	5.5%	19.5	8.5%	8.9%
$h \rightarrow WW^*$	15.0%	53.1	8.2%	8.6%
$h \rightarrow \tau\tau$	8.0%	28.2	4-6%	5-7%
$h \rightarrow ZZ$	1.7%	6.1	28(?)%	28(?)%
$h \rightarrow \gamma\gamma$	0.29%	1.02	23-30%	23-30%

$m_h = 120 \text{ GeV}$

Mode	$\Delta BR/BR$
bb	2.0 (2.7)%
cc	3.8 (7.3)%
gg	4.4 (8.9)%
WW*	3.5 (8.6)%

250 fb⁻¹ @250 GeV

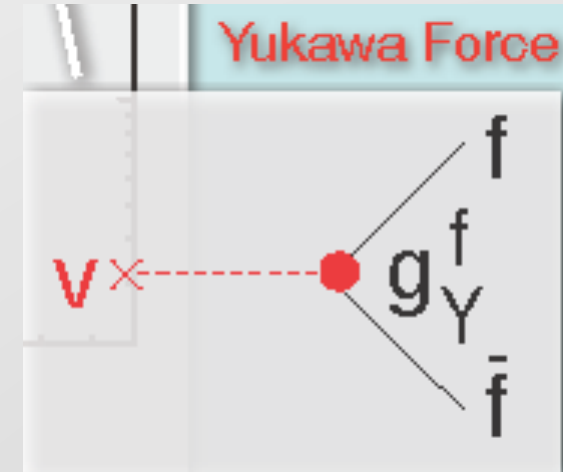

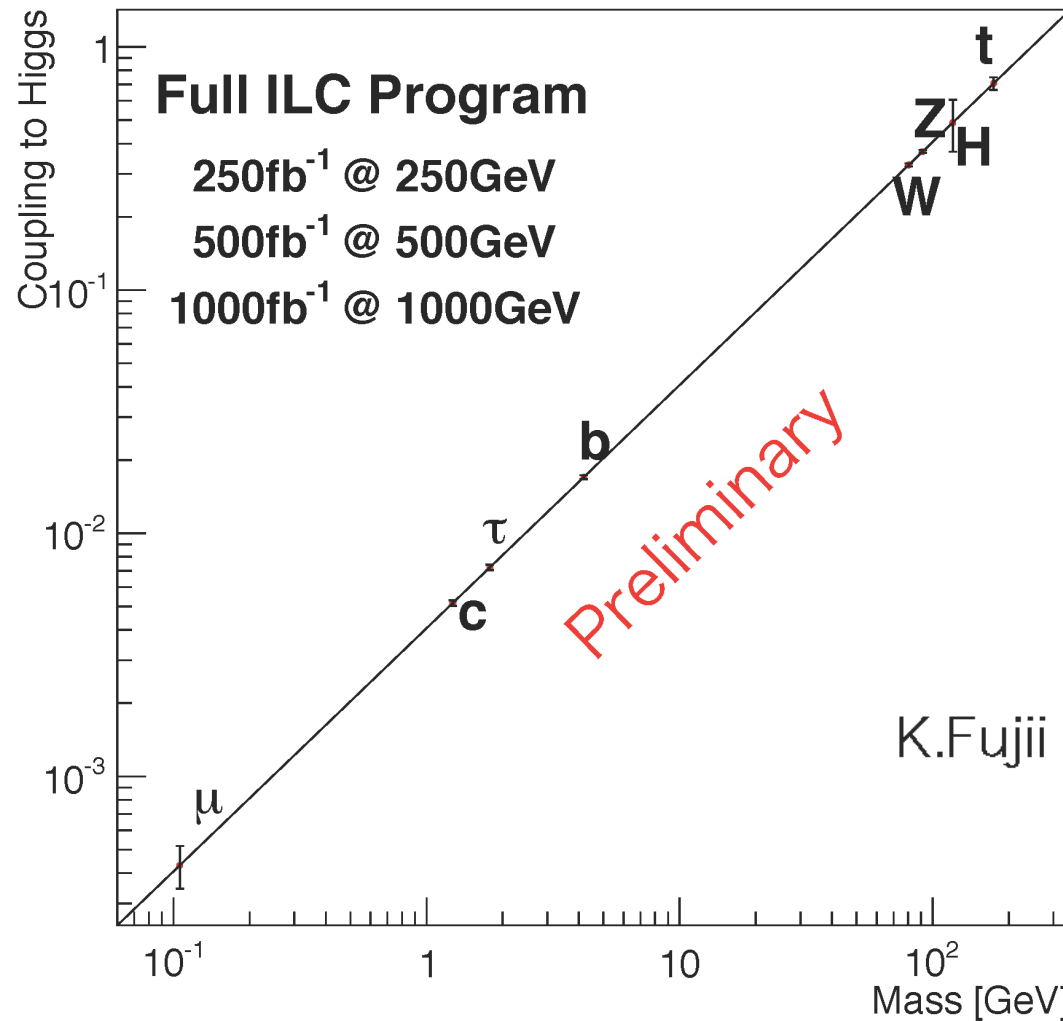

250 fb⁻¹ @250 GeV + 500 fb⁻¹ @500 GeV

Still very preliminary studies, need for optimization and learning...
 Example: @LEP, Altarelli et al 1989, Yellow Report, $\Gamma(Z \rightarrow b\bar{b}) \approx 5-8\%$
 final precision reached was $\Gamma(Z \rightarrow b\bar{b}) \approx 0.5\%$

Physics at Linear Colliders: Higgs Boson

Mass Coupling Relation

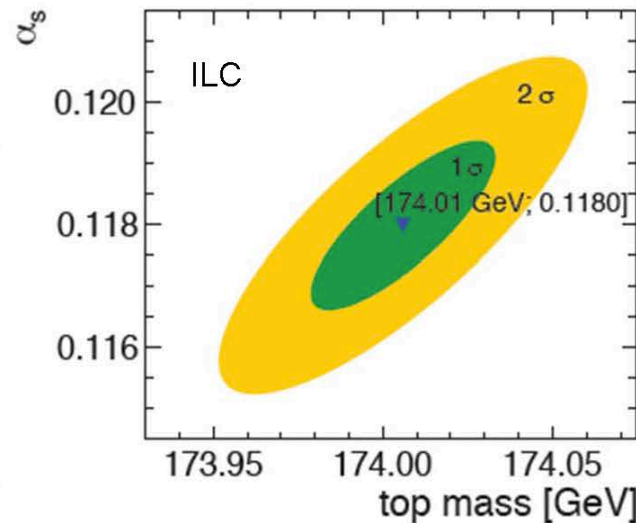

After Nominal Full ILC Program

Any deviation from the straight line signals BSM!

K.Fujii @ LCWS12, Oct.24, 2012

Physics program, 2nd step: “top physics, more than Higgs” ≤ 0.5 TeV (ILC+CLIC)

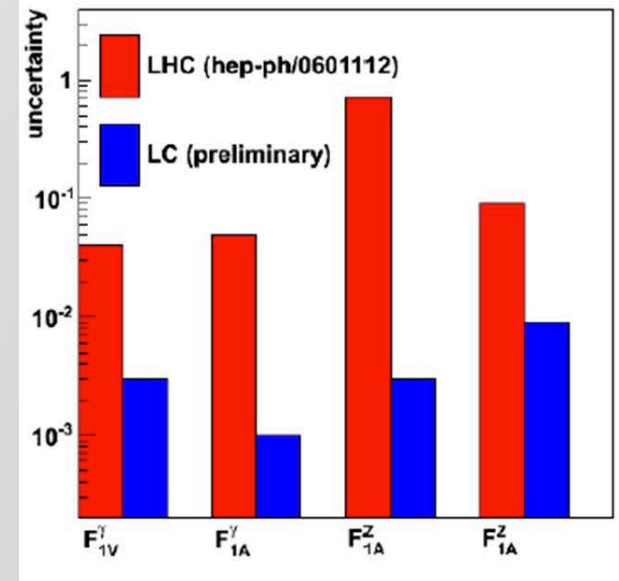

Top mass:

- At threshold, combined fit to 1S mass and α_s , Δm_t (stat.)=34 MeV and $\Delta \alpha_s$ (stat.)=0.0009, 100 fb^{-1} @500 GeV
- Above threshold reconstructing the invariant mass, Δm_t (stat.)=80 MeV, 100 fb^{-1} @500 GeV

Anomalous couplings: $t\bar{t}Z + t\bar{t}\gamma$

[Vos, Rou  n  ]

Physics at Linear Colliders: which precision ?

Decoupling Theorem

When new physics at scale M are large, low energy theory is the SM
Up to m^2/M^2 [O(1-10)% for $M=\text{TeV}$]

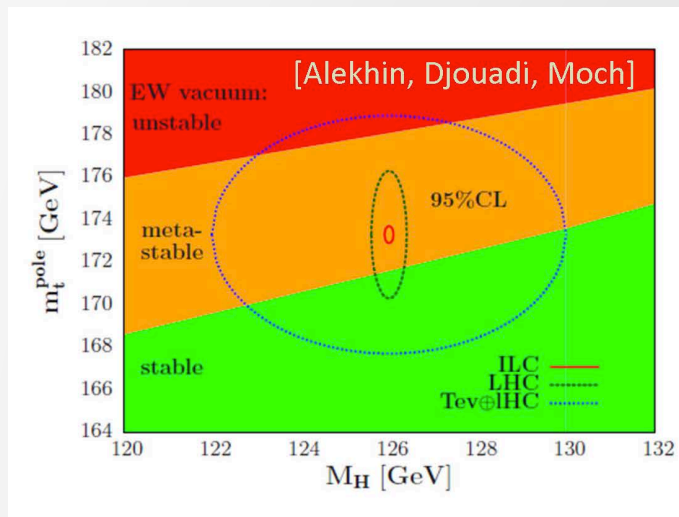

i.e., 1% precision will mean $M=3 \text{ TeV}$
for ILC reach (M. Peskin)

Supersymmetry: $g(\tau)/SM = 1 + 10\% \left(\frac{400 \text{ GeV}}{m_A} \right)^2$

$$g(b)/SM = g(\tau)/SM + (1 - 3)\%$$

Little Higgs: $g(g)/SM = 1 + (5 - 9)\%$
 $g(\gamma)/SM = 1 + (5 - 6)\%$

Composite Higgs: $g(f)/SM = 1 + (3 - 9)\% \cdot \left(\frac{1 \text{ TeV}}{f} \right)^2$

Stability of the Standard Model vacuum,

Validity of the Standard Model up to the Planck Scale ?

$$\Delta m_{\text{top}} < 200 \text{ MeV}$$

(Specially relevant to know if no NP are found at LHC
but..

if there are NP it will be even better, of course !!)

Challenges for ILC (0.25-1.0 TeV)/CLIC (0.5-3.0 TeV) detectors

- Vertex, “flavour tag” (heavy quark and lepton identification)

~1/5 r_{beampipe} , ~1/30 pixel size (ILC vs LHC),
 vtx 1-2 cm (ILC), vtx 2-3 cm (CLIC)
 ($h \rightarrow b\bar{b}, c\bar{c}, \tau^+\tau^-$)

$$\sigma_{ip} = 5\mu\text{m} \oplus 10-15\mu\text{m} / p \sin^{3/2} \theta$$

- Tracking, “recoil mass” ($e^+e^- \rightarrow Zh \rightarrow \ell^+\ell^-X$)

~1/6 material, ~1/7 resolution (ILC wrt LHC),
 B=4-5 T (CLIC and ILC)

$$\sigma(1/p) \leq 2 \times 10^{-5} \text{ GeV}^{-1}$$

- Particle Flow, Jet Energy Rec. → Tracker+Calo.

Di-jet mass Resolution, Event Reconstruction, Hermiticity,
 Detector coverage down to very low angle

CLIC vs ILC: Redesign Forward Region, HCAL $7,5 \lambda$

$$\sigma_E / E = 0.3 / \sqrt{E(\text{GeV})}$$

Challenges for ILC (0.25-1.0 TeV)/CLIC (0.5-3.0 TeV) detectors

- Due to experimental conditions
 - Manageable occupancies in the presence of beam-induced background
 - Radiation hardness for forward calorimetry
- Timing capabilities required for CLIC
 - All tracking detectors with $\sim 10\text{ns}$ time-stamping capability
 - Time precision on calorimeter hits of $\sim 1\text{ns}$

See talk by Lucie Linssen at LCWS12, Arlington, Oct. 22 2012

ILC Detector Roadmap

S. Yamada

Aug. 2007	Detector Concept Report, Four detector concepts: LDC, GLD, SiD, 4 th
Oct. 2007	ILCSC calls for LOIs and appoints Research Director (RD)
Jan. 2008	RD forms detector management
Mar. 2008	IDAG formed, Three LOIs groups identified
Mar. 2009	Three LOIs submitted (detector description, status of R&D, GEANT4 simulation, benchmark process, costs..)
Mar. 2009	IDAG began monitoring the progress
Aug. 2009	IDAG recommends validation of two (2) and ILCSC approves
Oct. 2009	Work plan of the validated groups
End 2011	Interim Report being produced (http://www.linearcollider.org/about/Publications/interim-report)
End 2012	Detailed Baseline Design Report (ILD TDR Volume 3) Including physics case for the ILC

Validated ILC Detectors: SiD & ILD

Both, ILD and SiD, are 4π detectors with complementary designs

Common Systems

Thin pixel vertex detectors
Si-W Electromagnetic Calorimeter

ILD

TPC tracking aided with silicon detectors

Scintillator-Steel hadron calorimeter

Excellent tracking and calorimetry performance for best possible event reconstruction

SiD

Silicon tracking

Gaseous (RPC) digital hadron calorimeter

Fast tracking and calorimeter for robustness

The DBD detector

- SiD is fully designed for push-pull (using a platform)
- PFA paradigm has driven design choices

ILD - Overall Design

Philosophy:
Large detector optimized for best resolution, providing flexibility for higher energies up into the TeV range

- ECAL
- forward calorimeters*
- LumiCAL
- BeamCAL, LHCAL
- silicon tracking*
- Silicon External Tracker
- Endplate Tracking Detector
- Forward Tracking Disks
- Silicon Inner Tracker
- VerTeX Detector

IDAG: International Detector Advisory Group (ILC)

Tasks:

- monitors the ILC detector research and development
- advises the Research Director
- reviewed 2009 Letters of Intent / recommended validation
- reviewed recent DBD drafts

Many thanks
for your help and dedication

IDAG membership includes

- experienced experimentalists:
Michael Danilov (ITEP), Michel Davier (Chair, Orsay), Paul Grannis (Stony Brook), Dan Green (FNAL), Dean Karlen (Victoria), Sun-Kee Kim (SNU), Tomio Kobayashi (Tokyo), Weigu Li (IHEP), Richard Nickerson (Oxford), Sandro Palestini (CERN)
- active phenomenology theorists
Christophe Grojean (CERN & CEA-Saclay), Rohini Godbole (IIS), JoAnne Hewett (SLAC)
- ILC accelerator experts
Thomas Himel (SLAC), Nobukazu Toge (KEK), Eckhard Elsen (DESY)

ILC Technical Design Report: Physics & Detector DBD

- Physics volume: ILC TDR, Volume 1, “Physics at the International Linear Collider”
- Detector volume: ILC TDR, Volume 3, “Physics and Detectors, Detailed Baseline Design”
- Chapters have been drafted and are in final phase of revision
 - Introduction (physics, organization, common detector aspects)
 - SiD & ILD
 - Future plans
- DBD drafts have been reviewed by IDAG
- Review by ILCSC’ s Project Advisory Committee (PAC), enlarged by a few IDAG members, at KEK 13-14 December
 - Revised Introduction to be submitted Nov 16
 - Final drafts of SiD & ILD to be submitted Nov 30
- Presented to ILCSC, February 21-22, 2013
- Published along with ILC TDR (Volume 1 –Physics- and Volume 3 –Detector-)

CLIC detector and physics study

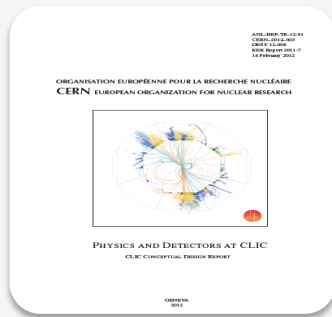

The CLIC CDR documents

Vol 1: The CLIC accelerator and site facilities (H.Schmickler)

- CLIC concept with exploration over multi-TeV energy range up to 3 TeV
- Feasibility study of CLIC parameters optimized at 3 TeV (most demanding)
- Consider also 500 GeV, and intermediate energy range
- In print: <https://edms.cern.ch/document/1234244/>

Vol 2: Physics and detectors at CLIC (L.Linssen)

- Physics at a multi-TeV CLIC machine can be measured with high precision, despite challenging background conditions
- External review procedure in October 2011
- Completed and printed early 2012 <http://arxiv.org/pdf/1202.5940v1>

Vol 3: “CLIC study summary” (S.Stapnes)

- Summary and available for the European Strategy process, including possible implementation stages for a CLIC machine as well as costing and cost-drives
- Proposing objectives and work plan of post CDR phase (2012-16)
- Completed and printed mid 2012 <http://arxiv.org/pdf/1209.2543v1>

Involves Physics and Detectors

Methods for beam-induced background suppression are established

1.2 TeV

100 GeV

$$e^+e^- \rightarrow H^+H^- \rightarrow \bar{t}b\bar{t} \rightarrow 8 \text{ jets}$$

1.2 TeV background in reconstruction time window

100 GeV background after tight cuts

All studies have full detector simulation and background overlay

2012 LC Workshops

CONFERENCIA PÚBLICA
Viaje al corazón de la materia
 François Richard (Orsay)

Parque de las Ciencia
 27 de septiembre, 19
 (en español, entrada libre)

El acelerador de partículas más poderoso del mundo, el LHC, comenzó a funcionar en el mes de septiembre. Su misión es explorar el lado oscuro de la materia para intentar descubrir algunos de los misterios más oscuros de la física.

¿Qué pasó después de Big Bang? ¿Por qué estamos hechos de materia y no de antimateria? ¿De dónde proviene la materia oscura? ¿Por qué las partículas elementales tienen las propiedades que tienen? ¿Por qué se formó la materia? ¿Por qué está hecha la materia oscura del Universo? ...

Quarks: U C T, D S B, Fuerzas: G, W, Z, γ, Leptones: E, μ, τ, ν_e, ν_μ, ν_τ, W, Z, γ

¿Supermasas? ¿Fuerzas débiles? ¿Separación de fases? ¿Aparecen los dominios? ¿Hay? ¿Cargas frías? ¿Aparecen los ruidos? ¿Aparecen los espejos? ¿Aparecen los espejos?

(see B. Foster talk for details)

UNIVERSITY OF TEXAS ARLINGTON COLLEGE OF SCIENCE presents

Dr. Steven Weinberg
 Nobel Laureate and Distinguished Professor of the Department of Physics and Department of Astronomy at UT Austin

“The Standard Model, Higgs Boson: Who Cares?”

When: 7:30 p.m. Wednesday, October 24
 Where: Texas Hall, UT Arlington
 The event is free and open to the public

The International Workshop on Future Linear Colliders (www.lcws12.org) will be held at UT Arlington from Oct. 22-26, 2012. The conference will draw hundreds of physicists from around the world. As part of conference tradition, Professor Steven Weinberg of the University of Texas at Austin, a Nobel Laureate, will give a public lecture. He is one of the theorists who helped develop the Standard Model and was awarded the Nobel Prize in 1979 along with S. Glashow and A. Salam. With the discovery of a Higgs-like boson at the Large Hadron Collider at CERN in Geneva, Professor Weinberg's discovery in context of the Standard Model, the theory of particle physics, and perspectives on what the completion of the theory means to our everyday lives.

Steven Weinberg holds the Jack S. Josey Welch Foundation Regents Chair in Science at UT Arlington. He has been honored with numerous prizes and awards, including the Nobel Prize in Physics in 1979 and the National Medal of Science in 1991. In 2004 he received the Fermi Medal of the American Philosophical Society, with a citation that said he is "considered by many to be the most important theoretical physicist alive in the world today." He has been elected to the U.S. National Academy of Sciences and Britain's Royal Society, as well as to the American Philosophical Society and the American Academy of Arts and Sciences. He is the author of over 300 articles on elementary particle physics as well as numerous books and periodical articles. Educated at Cornell, Copenhagen and Princeton, he also holds honorary degrees from 16 other universities. He taught at Columbia, Berkeley, M.I.T., and Harvard before coming to UT Arlington.

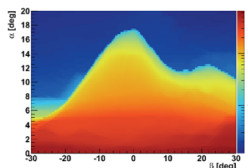

This event is made possible thanks to the generous support of the UT Arlington Office of the President and the UT Arlington Department of Physics. For more information, please contact: jackymackay@uta.edu, Dr. Jaehoon Yu at jaehoonyu@uta.edu or Dr. Andrew White at awhite@uta.edu.

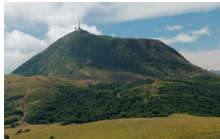

Spinoffs derived from LC detector R&D

**ILC Detector R&D:
Its Impact**

September 2011

ILC Research Directorate
Director: Sakue Yamada

Prepared by the Common Task Group for Detector R&D

Dhiman Chakraborty, Marcel Demarteau (convenor), John Hauptman, Ron Lipton, Wolfgang Lohmann, Tim Nelson, Aurore Savoy-Navarro, Felix Sefkow, Burkhard Schmidt, Tohru Takeshita, Jan Timmermans, Andy White, Marc Winter

An study of the spinoffs derived by the LC detector R&D has been performed (worth reading!)

It includes:

- HEP applications:
 - ✓ vertex developments (FAIR, Star, BelleII)
 - ✓ TPC Micromegas (T2K)
 - ✓ forward calorimeters (LHC)
 - ✓ trigger development (LHC, CAST)
 - ✓ software (Belle II, NOVA, AIDA, CLIC, μ -collider)

- None HEP applications:
 - ✓ X-ray imaging (astronomy, medicine, proton tomography, volcano tomography)
 - ✓ ASICs for Balloon experiments

Future LC objectives

Lyn Evans statements at LCWS12 (Arlington, Oct. 22 2012):

- Strongly support the Japanese initiative to construct a linear collider as a staged project in Japan.
- Prepare CLIC machine and detectors as an option for a future high-energy linear collider at CERN.
- Further improve collaboration between CLIC and ILC machine experts.
- Move towards a “more normal” structure of collaboration in the detector community to prepare for the construction of two high-performance detectors.

Summary

- With present LHC results, Linear Colliders in the center-of-mass energy range from 0.25 TeV to 3.0 TeV present a clear, excellent and very challenging physics case:
 - ✓ understanding Higgs physics and top physics at low energy (below 1.0 TeV)
 - ✓ exploring new physics above 1.0 TeV in the range of potential LHC discoveries
 - ✓ this knowledge will become essential to understand the next steps of the field
- The physics and detector Linear Collider community is solid and existing since more than 15 years. It is well organized worldwide, and starting 2013 ILC and CLIC will live under the same structure
- Detector R&D for ILC and CLIC is progressing correctly despite the very limited amount of resources
- Detector milestones are accomplished during 2012-2013
 - ✓ CLIC: CDR (Volume 3) document ready mid-2012, and
 - ✓ ILC: physics and detector TDR (Volumes 1 –physics- and 3-DBD report-) will ready by the end of 2012 (15th December)
- Cooperation for detector R&D within ILC and CLIC is very good
- Pioneering R&D has resulted in many spinoffs useful for applications inside the HEP community and also outside the HEP community. An effort has been performed to follow and document it
- Most present LC workshops are being jointly organized by both communities, ILC and CLIC

Are you sure ?
