

Implications of Higgs discovery and other recent data for SUSY

Thursday 18 April 2013 11:05 (22 minutes)

Both the ATLAS and the CMS experiments have discovered a Higgs boson with mass ~ 126 GeV while setting new stringent lower limits on superpartner masses. The LHCb collaboration has for the first time measured $BR(B_s \rightarrow \mu^+ \mu^-)$. I will present some implications of these results for supersymmetry and discuss ensuing prospects for SUSY searches at the LHC and in dark matter experiments.
