Y(nS) decays and spectroscopy at Belle

Thursday 18 July 2013 11:45 (15 minutes)

We report the results of a study of 352 million $\Upsilon(4S)$ decays in which the final state $\eta\Upsilon(1S)$ is observed. We observe two transitions, $\Upsilon(4S) \to \eta\Upsilon(1S)$ and $\Upsilon(1D) \to \eta\Upsilon(1S)$. The results on a search for $\chi_b(3P)$ spin triplet bottomonium states are presented as well. The data are produced by the KEKB e^+e^- collider and collected by the Belle detector.

Author: Prof. KWON, Youngjoon (Yonsei University)

Presenter: KROKOVNY, Pavel (Budker Institute of Nuclear Physics (RU))

Session Classification: Flavour Physics and fundamental symmetries

Track Classification: Flavour Physics and Fundamental Symmetries
