CHARGED PARTICLE MULTIPLICITY AND PSEUDORAPIDITY DENSITY IN pp COLLISIONS WITH ALICE AT THE LHC

Analysis carried out within the Minimum Bias and Underlying Event LHC Working Group
• **INEL>0** class of events used...
  – Selecting the events with at least one charged particle in $|\eta| < 0.8$ and $p_T > p_{T,\text{cut}}$

• ...where the charged multiplicity distribution from primary particles (excluding weak decays from strange particles) is determined by the number of charged primary particles in the same $\eta$ and $p_T$ range
  – Tracks in $|\eta| < 0.8$ and $p_T > p_{T,\text{cut}}$

• Same analysis carried out by ATLAS and CMS

• $p_{T,\text{cut}}$ set at 0.5, 1. GeV, for the results in common among the experiments

• In addition, $p_{T,\text{cut}}$ at 0.15 GeV considered, as this is ALICE intrinsic $p_{T,\text{cutoff}}$

• From this selection, $dN_{\text{ch}}/d\eta$ and multiplicity distributions were obtained
• **INEL>0** class of events used...
  – Selecting the events with at least one charged particle in \(|\eta| < 0.8\) and \(p_T > p_{T,\text{cut}}\)

• ...where the charged multiplicity distribution from primary particles (excluding weak decays from strange particles) is determined by the number of charged primary particles in the same \(\eta\) and \(p_T\) range
  – Tracks in \(|\eta| < 0.8\) and \(p_T > p_{T,\text{cut}}\)

• Same analysis carried out by ATLAS and CMS

• \(p_{T,\text{cut}}\) set at 0.5, 1. GeV, for the results in common among the experiments

• In addition, \(p_{T,\text{cut}}\) at 0.15 GeV considered, as this is ALICE intrinsic \(p_{T,\text{cutoff}}\)

• From this selection, \(dN_{\text{ch}}/d\eta\) and multiplicity distributions were obtained
Multiplicity Analysis – Response Matrix

- Unfolding technique used (see EPJ C68 (2010) 89) to determine the true multiplicity starting from the measured one ($\chi^2$ minimization with regularization)
  - To take into account detector resolution effects
  - Response Matrix (R) represents the probability that a collision with true multiplicity “$t$” is measured as an event with multiplicity “$m$”

\[ M_m = \sum_t R_{mt} T_t \]

- In order to reduce the effects of low statistics, and to extend the response matrix to higher multiplicity, a parameterization of the response matrix was obtained and used at higher multiplicities
- Event selection efficiency taken into account in unfolded (true) multiplicity

\( \sqrt{s} = 7 \text{ TeV}, p_{T,\text{cut}} = 0.15 \text{ GeV/c} \)
dN_{ch}/d\eta Analysis – Corrections

- Following the same method used for the previous ALICE dN_{ch}/d\eta measurements
- Basically: \frac{dN_{ch}}{d\eta} = \frac{\text{Tracks}}{\text{Events}}
to which the following corrections have to be applied:
  1. Track-to-particle correction
     - Track level
  2. Vertex reconstruction correction
     - Track and event level
  3. Event selection (or Trigger bias) correction
     - Track and event level
to take into account detector effects, resolution, decays, event selection efficiency...
- The difference in strangeness content between data and Monte Carlo was taken into account in the correction procedure (as for the Multiplicity analysis)
Systematics: $<p_T>$ vs Multiplicity

- Many systematic uncertainty sources studied (see backup)
- In particular:
  - Monte Carlo description of $<p_T>$ vs Multiplicity not fully satisfactory
  - Important for Multiplicity distribution analysis where correlation between $<p_T>$ and multiplicity plays a fundamental role
  - Verified at Monte Carlo level
    - Negligible at 900 GeV, important at 7 TeV, especially in the lowest $p_{T,cut}$ in the high multiplicity region
  - Taken into account at 7 TeV unfolding data with two different Monte Carlo (ATLAS-CSC, Perugia-0) and adding an extra systematic uncertainty (up to 10%, 5%, 10% at high multiplicity for $p_{T,cut} = 0.15, 0.5, 1.0$ GeV/c)

EPS 2013 - QCD session  
C. Zampolli – ALICE
\( \sqrt{s} = 0.9 \text{ TeV}, p_{T,\text{cut}} = 0.15 \text{ GeV}/c \)

- Best Monte Carlo Description by Phojet
- EPOS, Pythia8 (4c) and Perugia-2011 deviate by 50% at high multiplicity
- EPOS is the best at very low multiplicity
Multiplicity distributions – MC Comparison – II

$\sqrt{s} = 7 \text{ TeV}, \ p_{T,\text{cut}} = 0.5 \text{ GeV/c}$

- Best Monte Carlo Description by EPOS
- Perugia-2011 within 20%
- ATLAS-CSC within 30% up to multiplicity 30

$P(N_{\text{ch}})$

$\sqrt{s} = 7 \text{ TeV}, |p_T| < 0.8, \ p_T > 0.50 \text{ GeV}$

Analysis:
- ALICE pp
- Atlas CSC (306)
- D6T (109)
- A (100)
- Perugia-0 (320)
- Pythia8 (1)

$P(N_{\text{ch}})$

$\sqrt{s} = 7 \text{ TeV}, |p_T| < 0.8, \ p_T > 0.50 \text{ GeV}$

Analysis:
- ALICE pp
- Perugia-2011 (350)
- Phojet
- EPOS LHC
- Pythia8 (4C)
$\sqrt{s} = 7 \text{ TeV}, p_{T,\text{cut}} = 1.0 \text{ GeV/c}$

- **Best Monte Carlo Description** by Pythia8 (1), EPOS
- Perugia-2011 within 30%, but deviates by 10% at low multiplicity
$dN_{\text{ch}}/d\eta = 0.9 \text{ TeV}$

$\sqrt{s} = 0.9 \text{ TeV}, p_{T,\text{cut}} = 0.15 \text{ GeV}/c$  

$\sqrt{s} = 0.9 \text{ TeV}, |\eta| < 0.8, p_T > 0.15 \text{ GeV}$

- ALICE pp
- Atlas CSC (306)
- D6T (109)
- A (100)
- Perugia-0 (320)
- Perugia-2011 (350)
- Pythia8 (1)
- Pythia8 (4C)
- Phojet
- EPOS LHC

Data/MC

$\sqrt{s} = 0.9 \text{ TeV}, p_{T,\text{cut}} = 0.5 \text{ GeV}/c$  

$\sqrt{s} = 0.9 \text{ TeV}, |\eta| < 0.8, p_T > 0.50 \text{ GeV}$

Comparison with ATLAS in the case of $p_{T,\text{cut}} = 0.5$ and 1.0 GeV/c

$\sqrt{s} = 0.9$ TeV, $p_{T,\text{cut}} = 0.5$ GeV/c

$\sqrt{s} = 0.9$ TeV, $p_{T,\text{cut}} = 1.0$ GeV/c

- ALICE and ATLAS in agreement within 10% up to intermediate multiplicity; 20% at high multiplicity
- ALICE measures up to higher multiplicities than ATLAS
Multiplicity – Comparison with ATLAS – 7 TeV

- Comparison with ATLAS in the case of $p_{T,\text{cut}} = 0.5$ and $1.0$ GeV/c

$\sqrt{s} = 7$ TeV, $p_{T,\text{cut}} = 0.5$ GeV/c

$\sqrt{s} = 7$ TeV, $p_{T,\text{cut}} = 1.0$ GeV/c

- ALICE and ATLAS in agreement within 10% almost over the whole spectrum
- ATLAS goes to higher multiplicities than ALICE

- Comparison with ATLAS in the case of $p_{T,\text{cut}} = 0.5$ and 1.0 GeV/c

- Plots already presented within the MB&UE LHC Working Group
- ALICE lower by $\sim 2\%$ wrt ATLAS and CMS for the lowest $p_{T,\text{cut}}$
- Very good agreement for $p_{T,\text{cut}} = 1.0$ GeV
\( \frac{dN_{ch}}{d\eta} \) – Comparison to ATLAS and CMS – 7 TeV

- Comparison with ATLAS in the case of \( p_{T,\text{cut}} = 0.5 \) and 1.0 GeV/c

\[ \sqrt{s} = 7 \text{ TeV}, \ p_{T,\text{cut}} = 0.5 \text{ GeV}/c \]

\[ \sqrt{s} = 7 \text{ TeV}, \ N_{ch} \geq 1, \ p_{T} > 0.5 \text{ GeV}, \ |\eta| < 0.8 \]

\[ \sqrt{s} = 7 \text{ TeV}, \ N_{ch} \geq 1, \ p_{T} > 1 \text{ GeV}, \ |\eta| < 0.8 \]

- Plots already presented within the MB&UE LHC Working Group, ALICE points updated
- ALICE lower by ~2% wrt ATLAS and CMS for the lowest \( p_{T,\text{cut}} \)
- Very good agreement for \( p_{T,\text{cut}} = 1.0 \) GeV

EPS 2013 - QCD session

C. Zampolli – ALICE
Summary and Conclusions

- **INEL>0** class considered for charged particle multiplicity and pseudorapidity density distributions
  - Selecting events with at least 1 charged primary particle in $|\eta| < 0.8$, $p_T > p_{T,\text{cut}}$ (0.15, 0.5, 1.0 GeV/c)
  - Counting only the charged primary particles satisfying the same requirement
- **Monte Carlo** description of the measurements generally not very satisfactory
  - Different behaviour depending on the energy of the system, of the $p_{T,\text{cut}}$ and sometimes of the measurement
  - **EPOS** (LHC) seems to be the Monte Carlo generator that in general best describes the data
    - Consistent treatment of cross-section calculation and particle production including energy conservation
    - Final states of the scattering described as flux tubes, eventually constituting bulk matter which thermalizes and expands collectively (hydrodynamically – statistical decay + flow), or escape and hadronize as jets
- **Comparison with ATLAS and CMS** (for $dN_{\text{ch}}/d\eta$) presented
  - Very good agreement, within systematics
Summary and Conclusions

• **INEL>0** class considered for charged particle multiplicity and pseudorapidity density distributions
  - Selecting events with at least 1 charged primary particle in |\(\eta|<0.8,\) \(p_T>p_T,\text{cut}(0.15,0.5,1.0\text{ GeV/c})\)
  - Counting only the charged primary particles satisfying the same requirement

• **Monte Carlo** description of the measurements generally not very satisfactory
  - Different behaviour depending on the energy of the system, of the \(p_T,\text{cut}\) and sometimes of the measurement
  - **EPOS** (LHC) seems to be the Monte Carlo generator that in general best describes the data
    - Consistent treatment of cross-section calculation and particle production including energy conservation
    - Final states of the scattering described as flux tubes, eventually constituting bulk matter which thermalizes and expands collectively (hydrodynamically – statistical decay + flow), or escape and hadronize as jets

• **Comparison with ATLAS and CMS** (for \(dN_{\text{ch}}/d\eta\)) presented
  - Very good agreement, within systematics

**More Multiplicity measurements by ALICE to come**
- More energies, higher statistics, different multiplicity estimators, more event classes...
“so many out-of-the-way things had happened lately, that Alice had begun to think that very few things indeed were really impossible.”

L. Carrol, Alice’s Adventures In Wonderland

Outline

• Definitions
• The ALICE detector
• Analysis strategy
  – Multiplicity distributions
  – Multiplicity densities
• Results
  – Multiplicity distributions
  – Multiplicity densities
• Conclusions
The ALICE Experiment

- **A Large Ion Collider Experiment** is the experiment at the CERN Large Hadron Collider (LHC) dedicated to heavy-ion physics
  - The ultimate goal is the study of the Quark Gluon Plasma (QGP)
- Characterized by a very low intrinsic $p_T$ cut-off and very low material budget
  - Important role played in the LHC pp physics program
    - soft QCD
    - Monte Carlo tuning
    - Reference to Pb-Pb
- p-Pb collisions fundamental to interpret Pb-Pb
  - Disentangle between initial and final state effects
  - Low-x physics
The ALICE Detector

TPC Tracking

L3 magnet \( B = 0.5 \text{ T} \)

ITS Vtx, low-\( p_T \) trk, trigger

V0 Trigger

ALICE Tracking, \( \sqrt{s} = 0.9 \text{ TeV} \)

Detectors: 18

Tracking: 7

PID: 6

Calo: 5
• The **Inner Tracking System - ITS** ($|\eta| < 0.9$)
  – Six layers, three technologies: SPD, SDD, SSD
  – Primary and secondary vertex reconstruction
  – Tracking + standalone reconstruction
  – PID via $dE/dx$ (SDD+SSD analog read-out)
  – **Trigger** provided by SPD Fast-OR
    – MB, high multiplicity, topologies

• The **Time Projection Chamber – TPC**
  – Efficient tracking ($\sim$80%) in $|\eta| < 0.8$, $\sigma(p_T)/p_T \sim 5\%$ (simulation, current performance within expectations)
  – Momentum resolution (TPC+ITS) $\sigma(p_T)/p_T < 2.5\%$ up to 10 GeV/c
  – Two-track resolution $< 10$ MeV
  – PID (truncated mean over a max of 159 signals) with $\sigma_{dE/dx} \sim 5\%$ (isolated tracks, max number of clusters)
  – Space-point resolution 0.8 (1.2) mm in $xy$ ($z$)
ALICE ITS, TPC, V0

- The Inner Tracking System - ITS ($|\eta| < 0.9$)
  - Six layers, three technologies: SPD, SDD, SSD
  - Primary and secondary vertex reconstruction
  - Tracking + standalone reconstruction
  - PID via $dE/dx$ (SDD+SSD analog read-out)
  - Trigger provided by SPD Fast-OR
    - MB, high multiplicity, topologies

- The VZERO detector
  - Two arrays (VZERO-A, VZERO-C) of 32 scintillators each, at $2.8 < \eta < 5.1$ and $-3.7 < \eta < -1.7$
  - Providing trigger, luminosity and centrality (PbPb, pPb) measurement, event plane, charged-particle multiplicity at forward rapidity

$MB_{OR}$ trigger – used here – defined as a hit in either the SPD or in either VZERO-A or VZERO-C
Multiplicity Analysis – $\chi^2$ Minimization

- $\chi^2$ minimization with regularization

$$\chi^2(U) = \sum_m \left( \frac{M_m - \sum_t R_{mt} U_t}{e_m} \right)^2 + \beta P(U)$$

- Two regularizations tried

### Regularization 1

$$P_1(U) = \sum_t \frac{(U'_t)^2}{U_t} = \sum_t \frac{(U_t - U_{t-1})^2}{U_t}$$

- Constant relative “fluctuations”
  - Used mainly for systematic studies

### Regularization 2

$$P_2(U) = \sum_t \frac{(U'_t)^2}{U_t} = \sum_t \frac{(U_{t-1} - 2U_t + U_{t+1})^2}{U_t}$$

- Minimal relative curvature
  - Preferred and used for the results showed here

$M_m$ = Measured multiplicity at $m$, with error $e_m$
$R_{mt}$ = Response matrix for measured mult $m$ and true mult $t$
$U_t$ = Guessed unfolded spectrum for true mult $t$
$P(U)$ = Regularization function
$\beta$ = Regularization weight

Regularization damped at low multiplicity where data do not follow the constraint
Correction for event selection efficiency applied in unfolded (true) multiplicity variable

- $\sqrt{s} = 0.9$ TeV, $p_{T,\text{cut}} = 0.15$ GeV/$c$
- $\sqrt{s} = 0.9$ TeV, $p_{T,\text{cut}} = 0.5$ GeV/$c$
- $\sqrt{s} = 0.9$ TeV, $p_{T,\text{cut}} = 1.0$ GeV/$c$
- $\sqrt{s} = 7$ TeV, $p_{T,\text{cut}} = 0.15$ GeV/$c$
- $\sqrt{s} = 7$ TeV, $p_{T,\text{cut}} = 0.5$ GeV/$c$
- $\sqrt{s} = 7$ TeV, $p_{T,\text{cut}} = 1.0$ GeV/$c$
Systematic Uncertainties

• Both for Multiplicity Distributions and $dN_{\text{ch}}/d\eta$
  – Track cuts (including primary selection)
  – Particle composition
  – Diffraction (SD, ND, DD fractions)
  – Material Budget
  – Pile-up
  – Event selection efficiency
  – Tracking (ITS and TPC) efficiency difference between data and MC
  – Strangeness

• For Multiplicity Distributions only
  – Unfolding
    • Bias
    • Regularization
\[ \sqrt{s} = 0.9 \text{ TeV}, \ p_{T,\text{cut}} = 0.15 \text{ GeV/c} \quad \sqrt{s} = 0.9 \text{ TeV}, \ p_{T,\text{cut}} = 0.5 \text{ GeV/c} \quad \sqrt{s} = 0.9 \text{ TeV}, \ p_{T,\text{cut}} = 1.0 \text{ GeV/c} \]

\[ \sqrt{s} = 7 \text{ TeV}, \ p_{T,\text{cut}} = 0.15 \text{ GeV/c} \quad \sqrt{s} = 7 \text{ TeV}, \ p_{T,\text{cut}} = 0.5 \text{ GeV/c} \quad \sqrt{s} = 7 \text{ TeV}, \ p_{T,\text{cut}} = 1.0 \text{ GeV/c} \]

Spectrum limit defined taking into account the measured spectrum and the efficiency from the response matrix.
\( \sqrt{s} = 0.9 \text{ TeV}, p_{T,\text{cut}} = 0.5 \text{ GeV/c} \)

- **Best Monte Carlo Description** by EPOS, Perugia-0 up to multiplicity = 15
- ATLAS-CSC, Perugia-2011, Pythia8 (4c) within 20%, better than EPOS and Perugia-0 for multiplicity in [15, 20]
· **Best Monte Carlo Description** by D6T, A100, Perugia-2011, Pythia8 (4c), Pythia8 (1)
· Perugia-0 pretty good but seems to underestimate at high multiplicities
· Phojet, EPOS pretty far especially at high multiplicities
Multiplicity distributions – MC Comparison – VI

$\sqrt{s} = 7$ TeV, $p_{T,\text{cut}} = 0.15$ GeV/c

- Best Monte Carlo Description by EPOS and Perugia-2011
- EPOS good along the whole spectrum
- All the others pretty far
\[ dN_{ch}/d\eta - p_T,\text{cut} = 1 \text{ GeV}/c \]

\( \sqrt{s} = 0.9 \text{ TeV}, p_T,\text{cut} = 1.0 \text{ GeV}/c \)

\( \sqrt{s} = 7 \text{ TeV}, p_T,\text{cut} = 1.0 \text{ GeV}/c \)
