Inclusive and dijet jet production measured with the ATLAS detector

Thursday 18 July 2013 10:15 (15 minutes)

Inclusive jet and dijet double differential cross sections have been measured in proton-proton collisions using the ATLAS detector. The cross sections were measured using jets clustered with the anti- k_T algorithm. The data are compared to expectations based on next-to-leading order QCD calculations corrected for nonperturbative effects, as well as to next-to-leading order Monte Carlo predictions. Ratios of cross sections measured at different centre-of-mass

energies allow for reduced experimental and/or theoretical uncertainties. An NLO QCD analysis of the data indicates constraining power for the gluon density.
