

Towards the Heavy-Ion Program at J-PARC

Hiroyuki Sako (ASRC/J-PARC, JAEA)
for J-PARC HI Collaboration

QM2014, Darmstadt

1. Introduction
2. Heavy ion acceleration scheme
3. Physics goals
4. Experimental design
5. Summary

Introduction

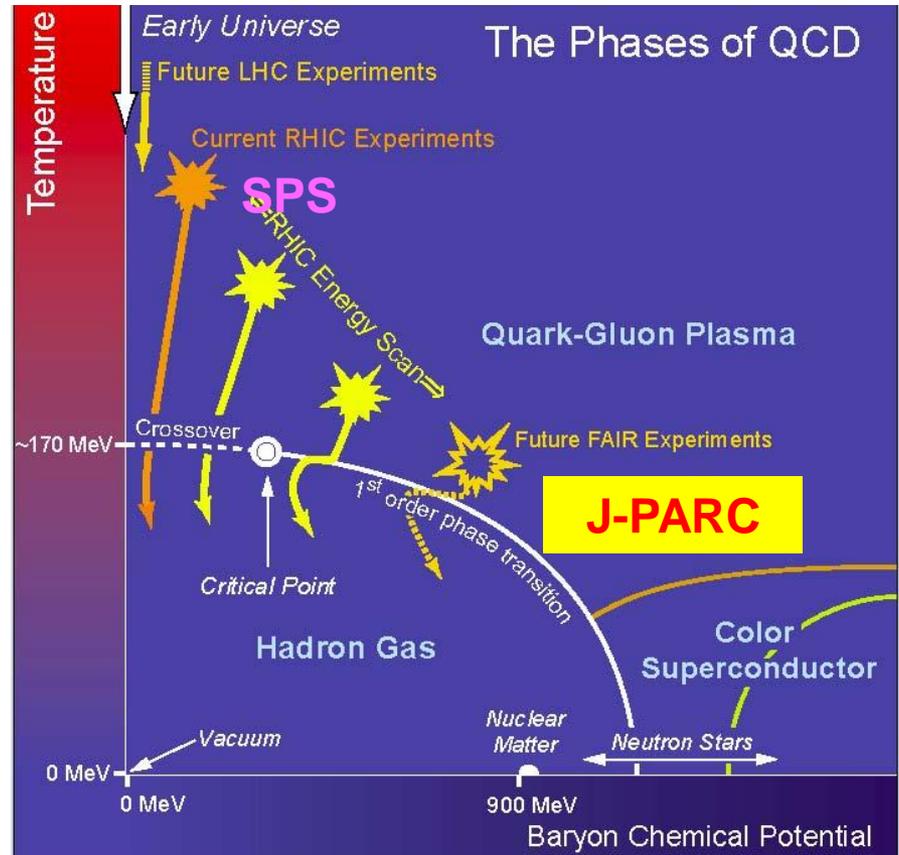

J-PARC will achieve designed beam power with proton beams in a few years

- 1MW at 3GeV
- 0.75MW at 30 GeV

We started discussing experimental and accelerator schemes for heavy ion program at J-PARC

We aim at studies of QCD phase structures in high baryon density regime at J-PARC

▶ RHIC low energy scan, NICA, FAIR

Hadron Seminar @J-Parc Takao Sakaguchi

J-PARC Tokai, Japan

400 MeV H⁻ Linac

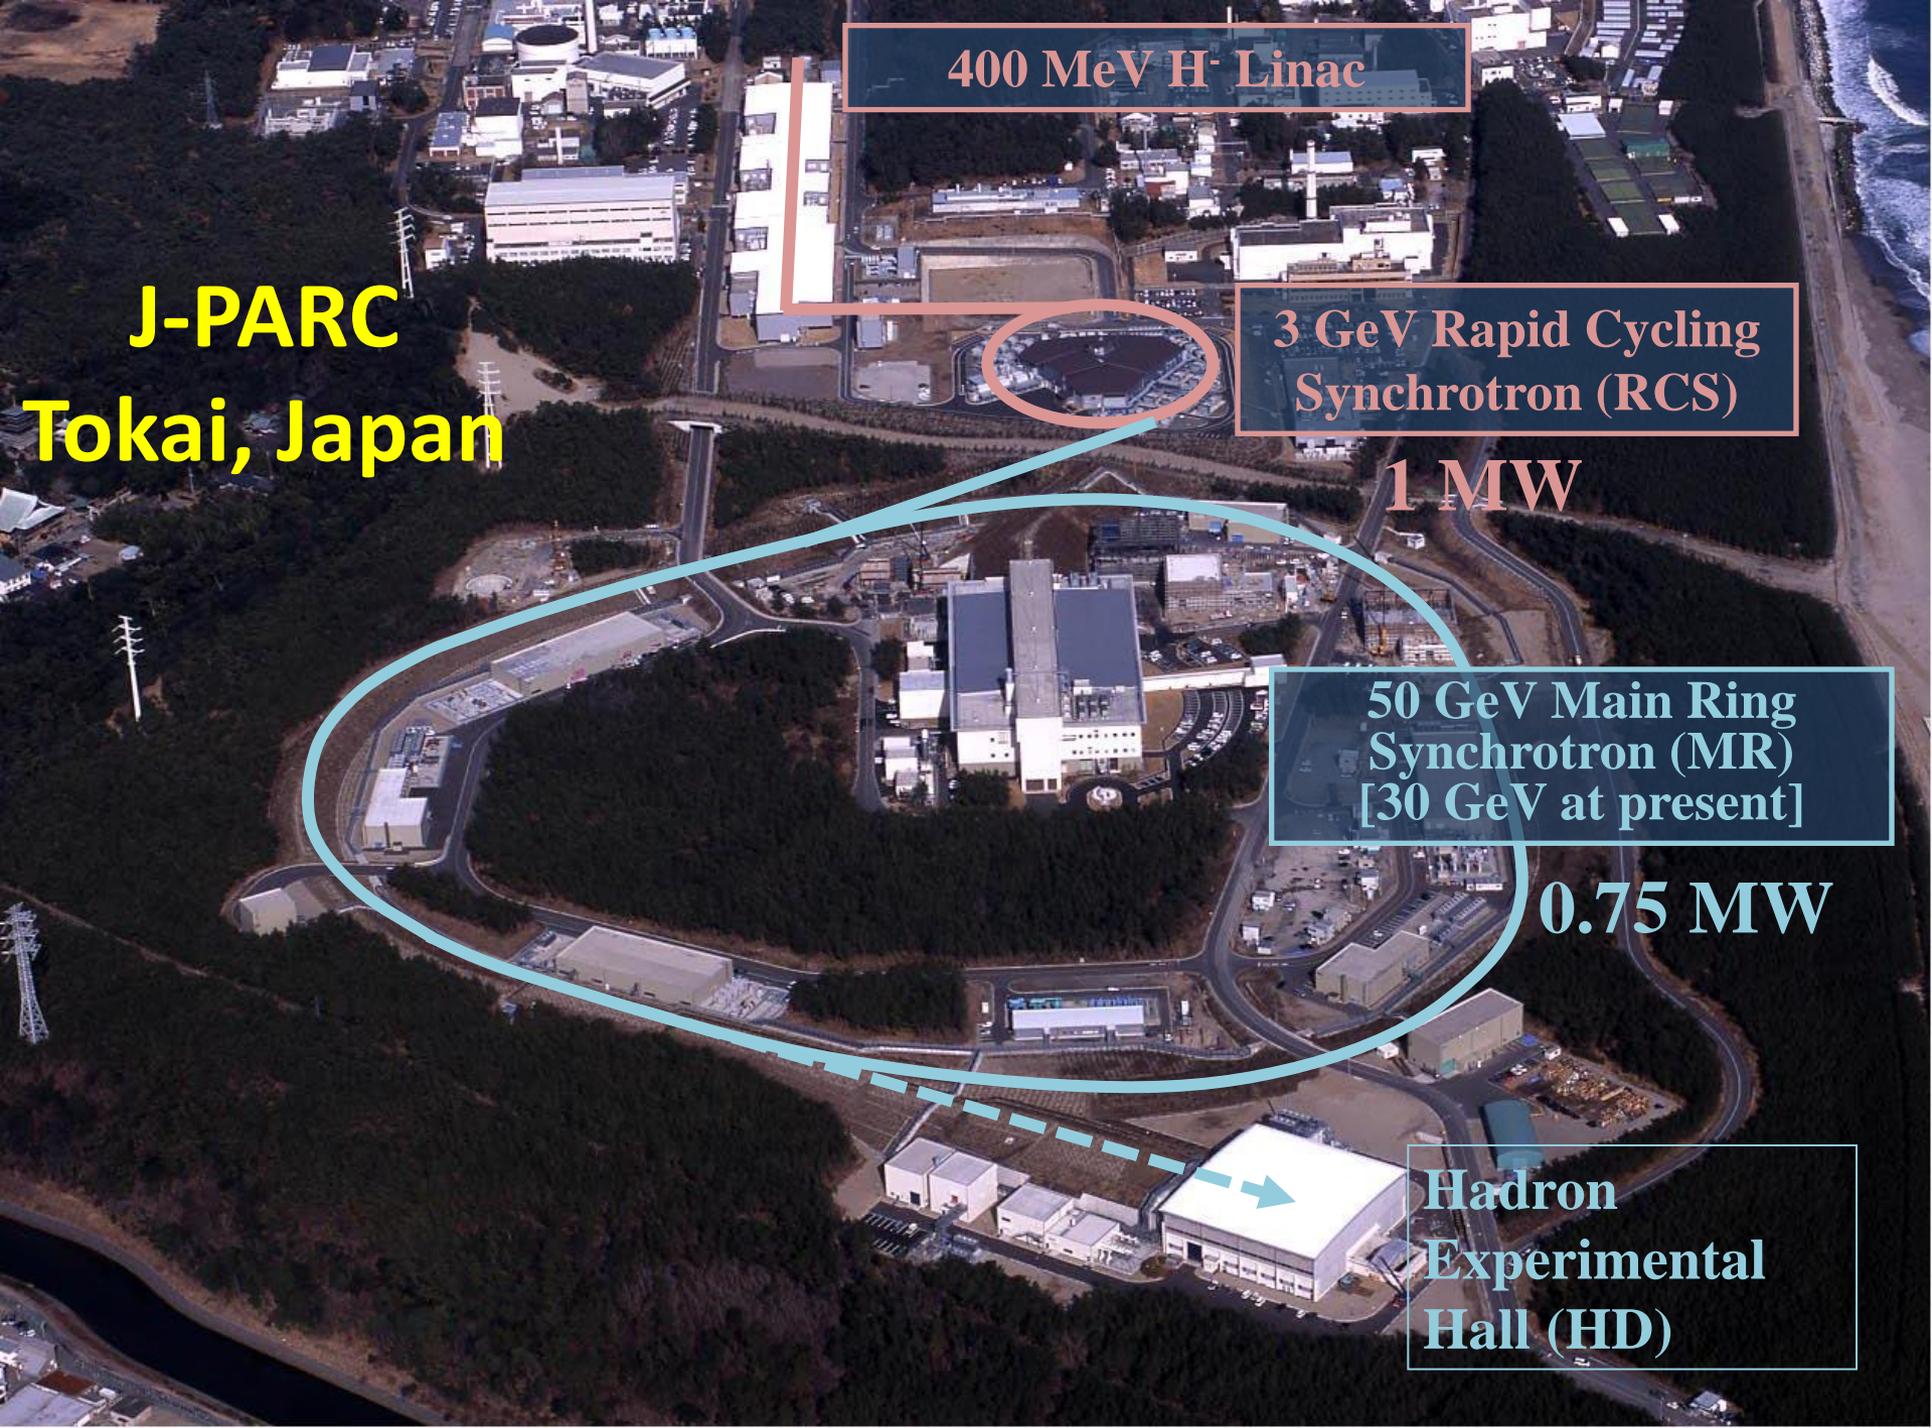

3 GeV Rapid Cycling
Synchrotron (RCS)

1 MW

50 GeV Main Ring
Synchrotron (MR)
[30 GeV at present]

0.75 MW

Hadron
Experimental
Hall (HD)

Low and High energy programs

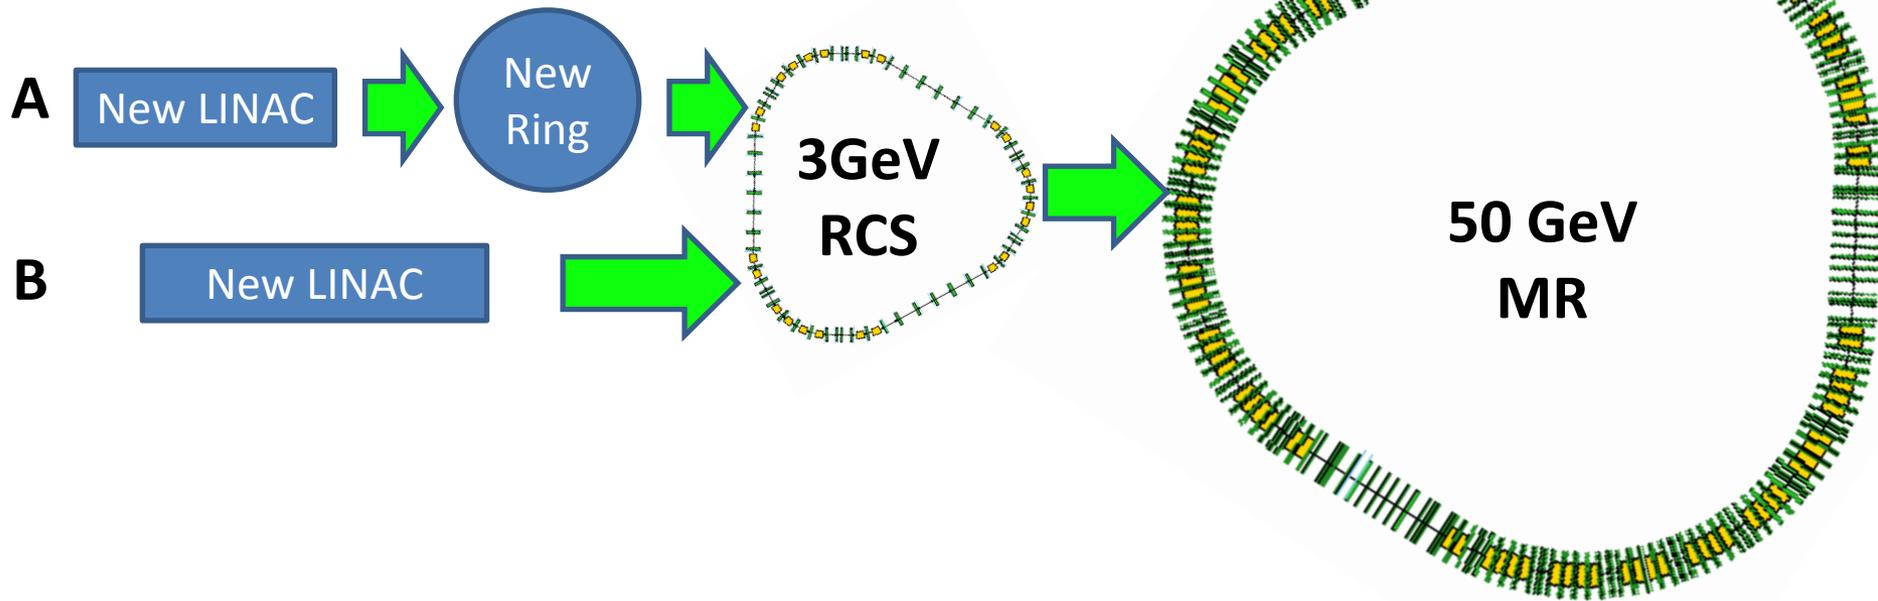

“Low energy” program (Linac) for unstable nuclei research

- Ion species
 - Ne, Ar, Fe, Ni, Kr, Xe,...,U
- Beam energy
 - 1 - 10 AMeV (U)
- Beam current
 - 10-30 pμA
 - 10ms, 25Hz

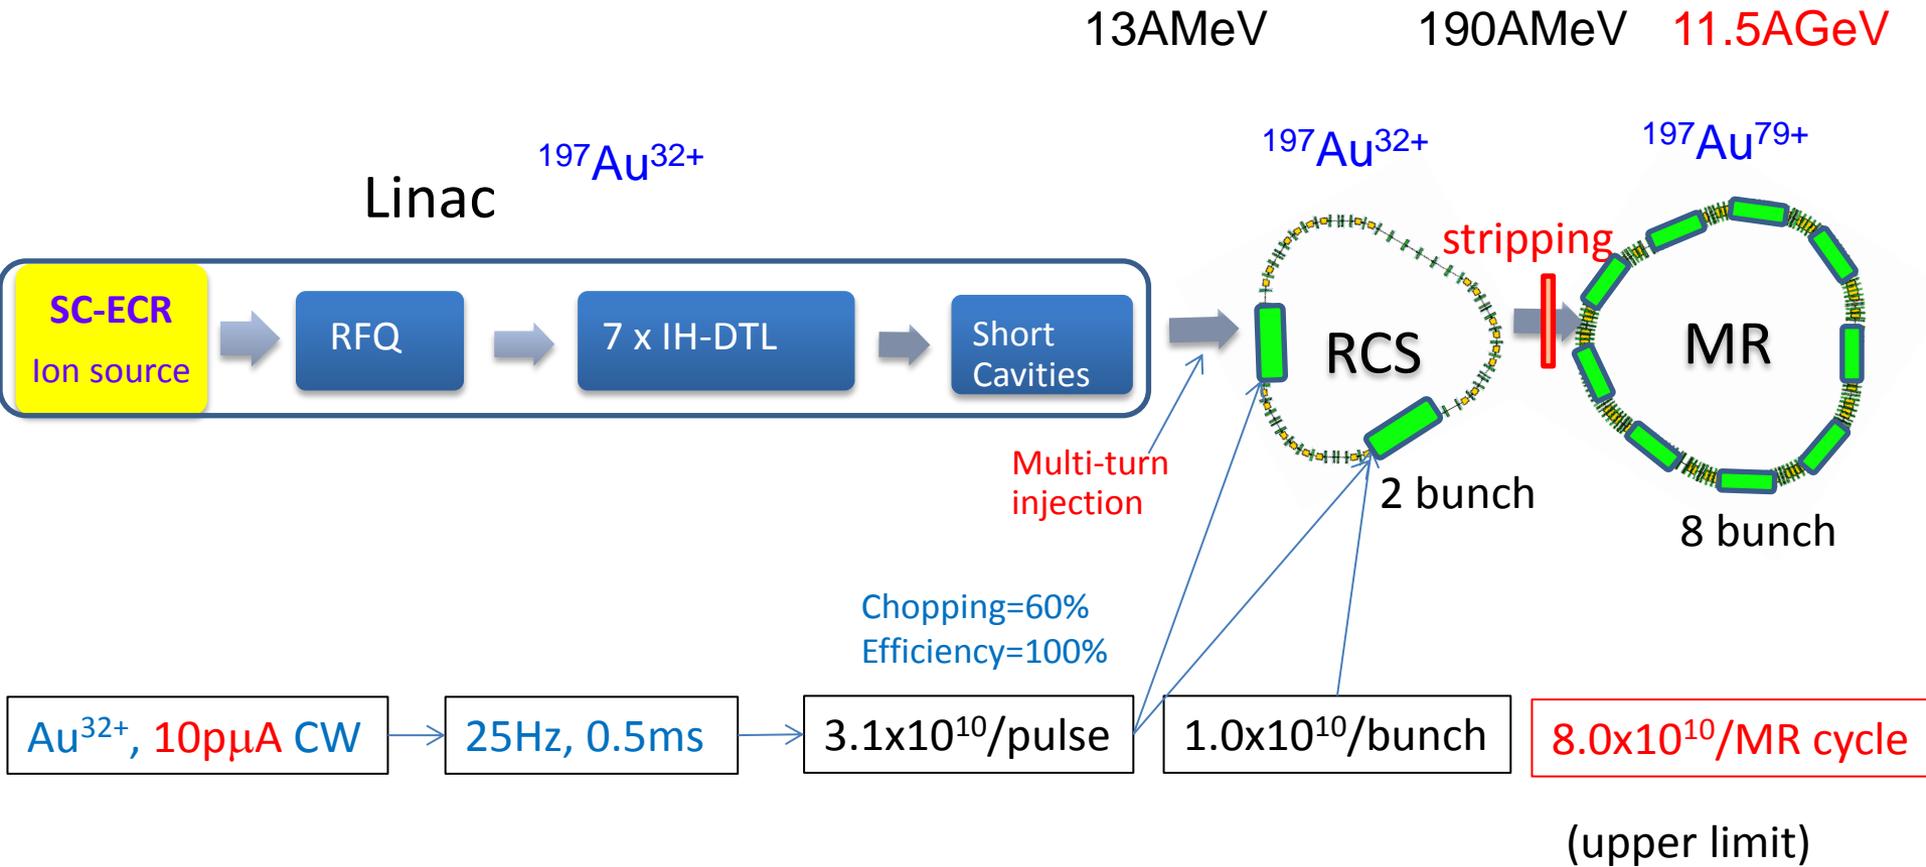

“High Energy” Program (50 GeV MR)

- Ion species
 - p, Si, Cu, Au, U
 - Au → U
 - Baryon density
 - $7.5\rho_0 \rightarrow 8.6\rho_0$ (JAM)
 - Duration at $\rho > 5\rho_0$
 - $4 \rightarrow 7$ fm/c
- Beam energy
 - 1 - 11.6 AGeV (U) ($\sqrt{s_{NN}} = 4.9\text{GeV}$)
 - Possibly 19 AGeV ($\sqrt{s_{NN}} = 6.2\text{GeV}$)
- Rate
 - 10^{10} - 10^{11} ions per cycle (~a few sec)

Possible accelerator schemes

An example of acceleration scheme (with new HI Linac)

Physics goals

- Systematic and precise hadron measurements
 - Identified particle spectra ($K/\pi, \dots$)
 - Multi-strange baryons
 - Correlations (Event-by-event fluctuations, flow, HBT)

- **Electrons and Muons**

- Di-lepton spectra of $\rho/\omega/\phi$

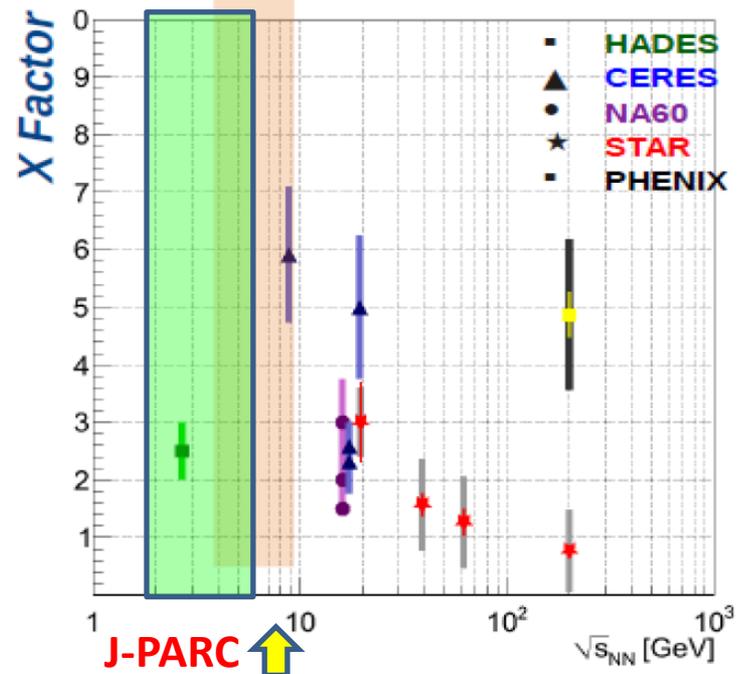

- **Rare particles**

- Hypernuclei
- Exotic hadrons
 - $\Lambda(1405)$
 - H-dibaryon
 - K^-pp
- Charm
 - $J/\psi, D$

- **Photons**

- Thermal photons from QGP

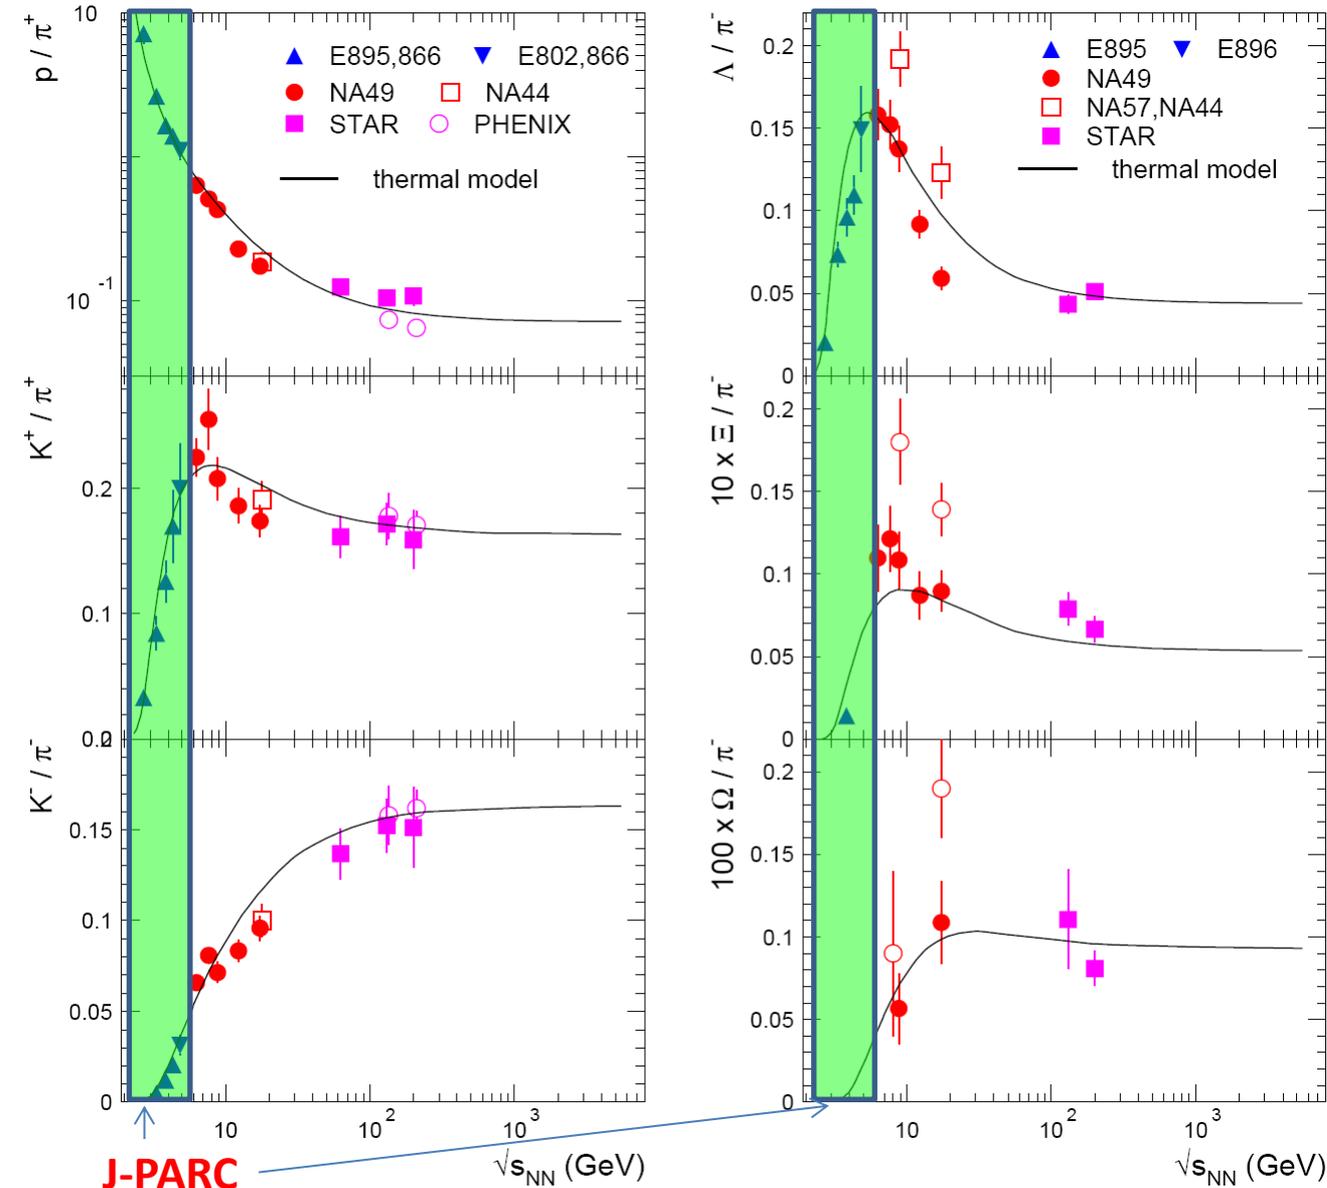

Published low-mass enhancement factors
P. Braun-Munzinger, JHI2014 workshop

Maximum baryon density
at freezeout

(Randrup, PRC74(2006)047901)

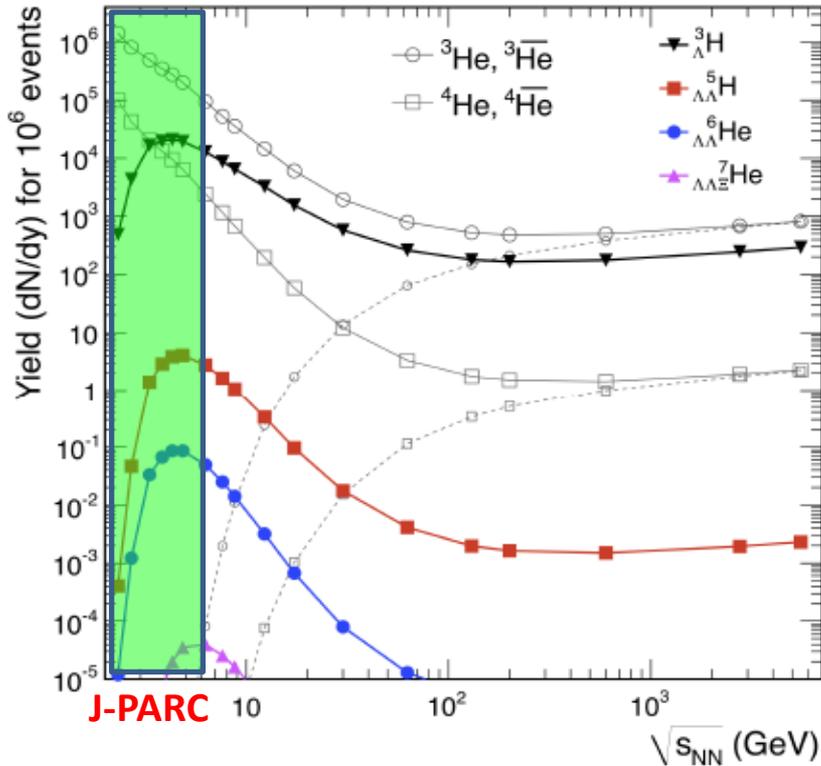

Strange meson/baryons

Strangeness enhancement at ~ 10 GeV is connected to high baryon density via hyperons

Energy scan with high statistics

Hypernuclei

Maximum yield at J-PARC

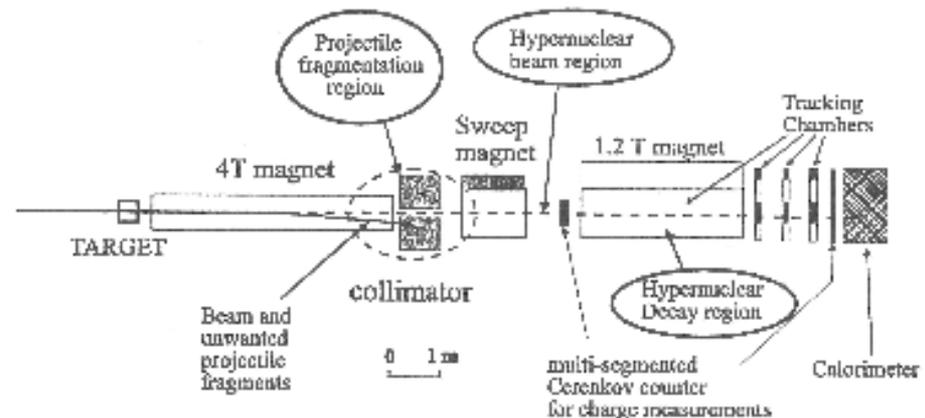

- coalescence of high-density baryons

Hypernuclei $S=-3$ in HI collisions

Closed geometry configuration for projectile region?

KEK Report 2000-11
Expression of Interest for
Nuclear/Hadron Physics Experiments
at the 50-GeV Proton Synchrotron

Particle production rates

Beam : 10^{11} Hz

0.1% target

→ Interaction rate 10^8 Hz

Centrality trigger 0.1%

→ 100kHz

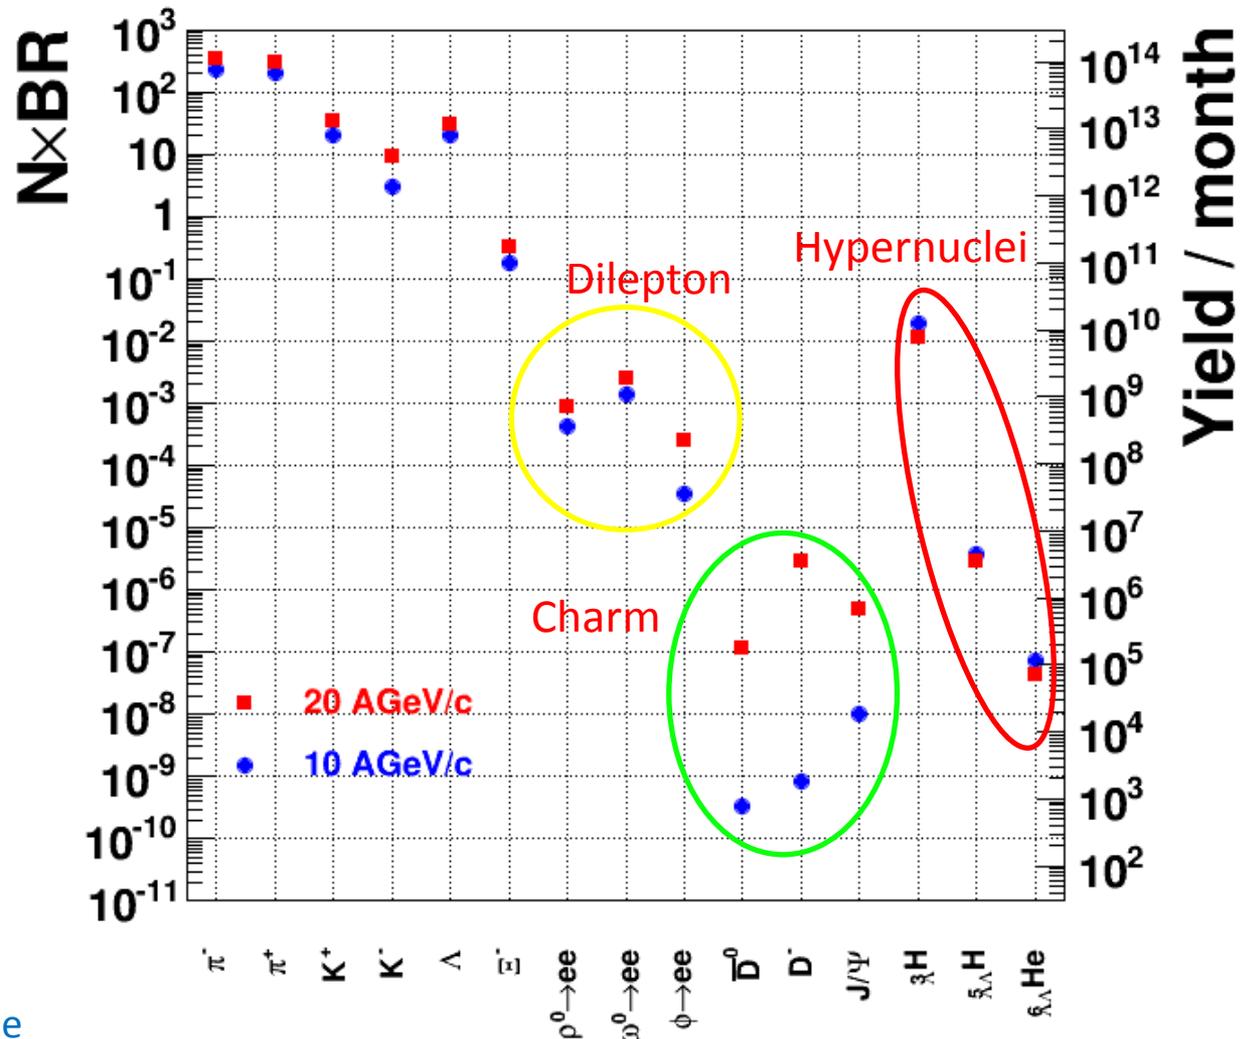

DAQ rate = 100kHz

In 1 month experiment:

$\rho, \omega, \phi \rightarrow ee$ $10^8 - 10^9$

$D, J/\Psi$ 10^6 (20 AGeV)
 $(10^3$ (10 AGeV))

Hypernuclei $10^5 - 10^{10}$

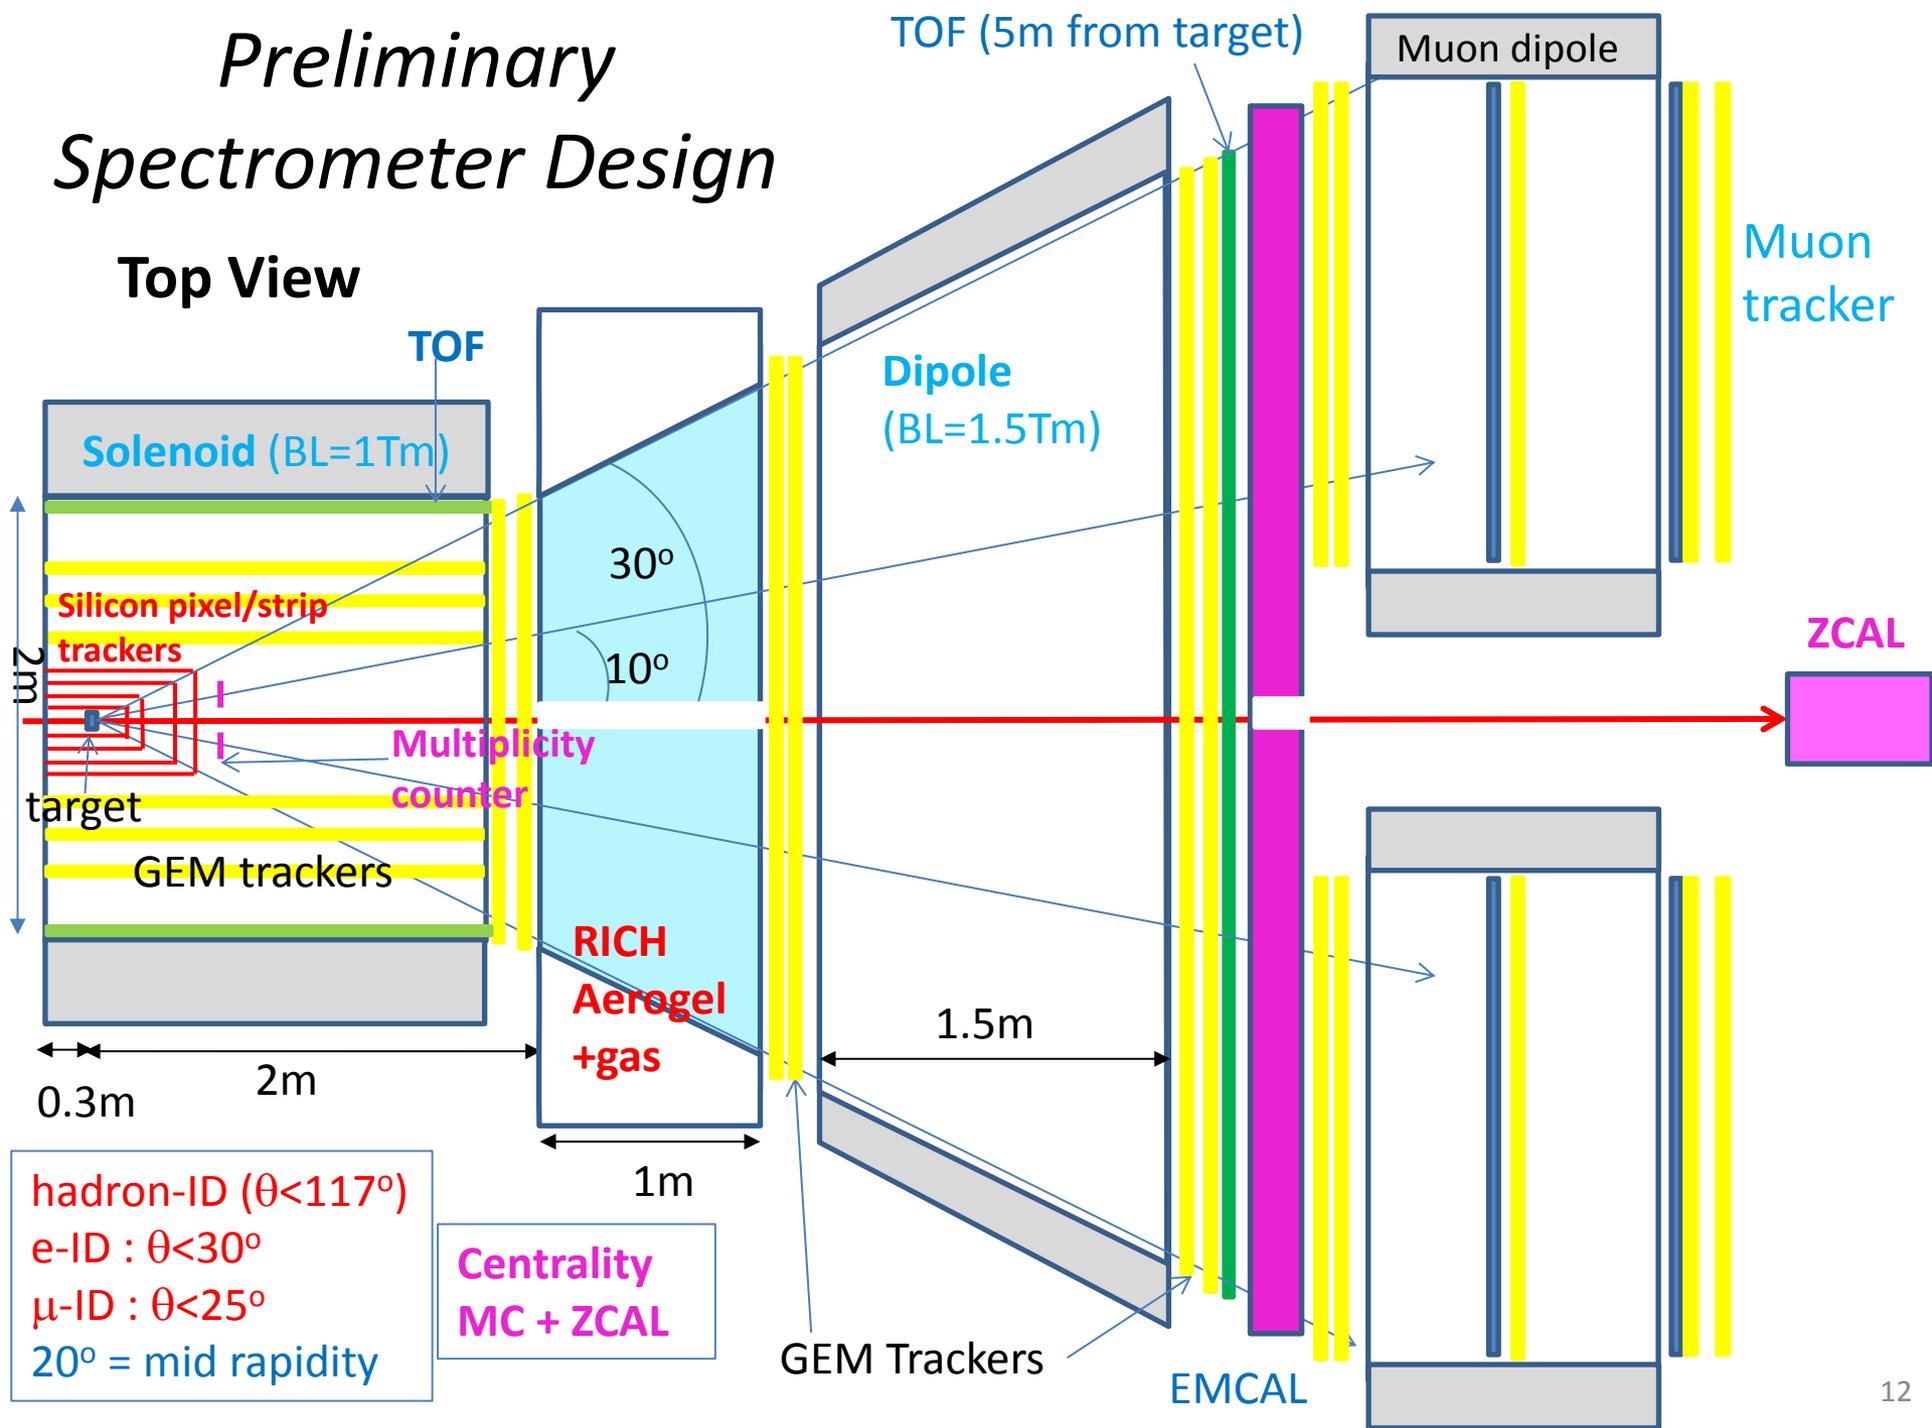

Ref: HSD calculations in FAIR Baseline
 Technical Report (Mar 2006)
 A. Andronic, PLB697 (2011) 203

Experimental requirements

- High rate capability
 - Fast detectors
 - Silicon trackers, MPGD (e.g. GEM) trackers, ...
 - Extremely fast DAQ
 - $\geq 100\text{kHz}$
- High granularity
 - Pixel size $< 3 \times 3 \text{mm}^2$
(at 1m, $\theta < 2\text{deg}$, 10% occupancy)
- Large acceptance ($\sim 4\pi$)
 - Multiplicity for e-b-e fluctuations
 - Backward physics (target fragment region)

Preliminary Spectrometer Design

Top View

Particle-ID methods

e- π separation

RICH (C_5F_{12})
 $p < 3.4 \text{ GeV}/c$ (20mrad)

$\mu - \pi$ separation

- $p < 0.8 \text{ GeV}/c$
TOF with 30ps (MRPD) in 5 m TOF
- $p = 0.8 - 1.5 \text{ GeV}/c$
RICH (Aerogel)
- $p > 1.5 \text{ GeV}/c$ (20mrad)
Fe absorbers + Trackers

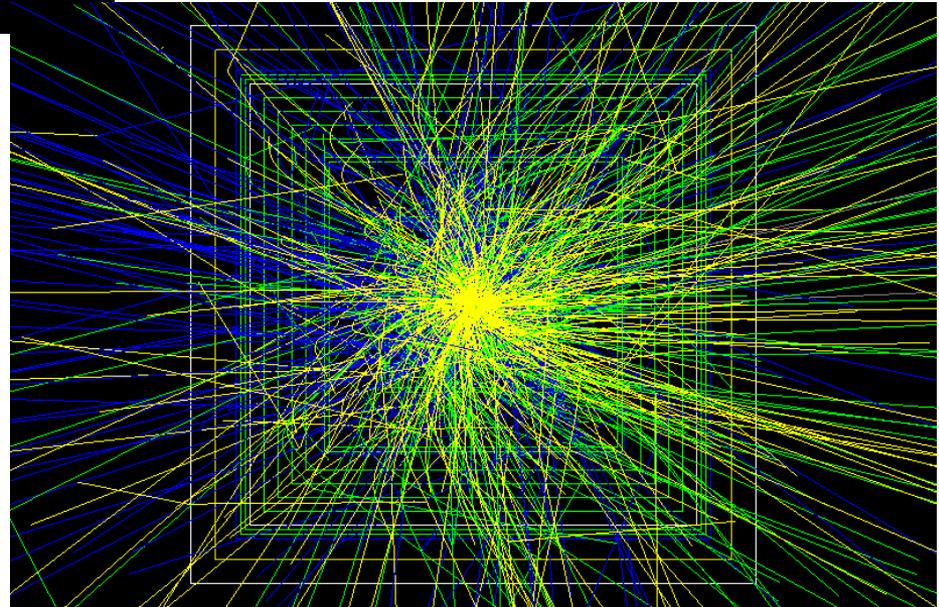

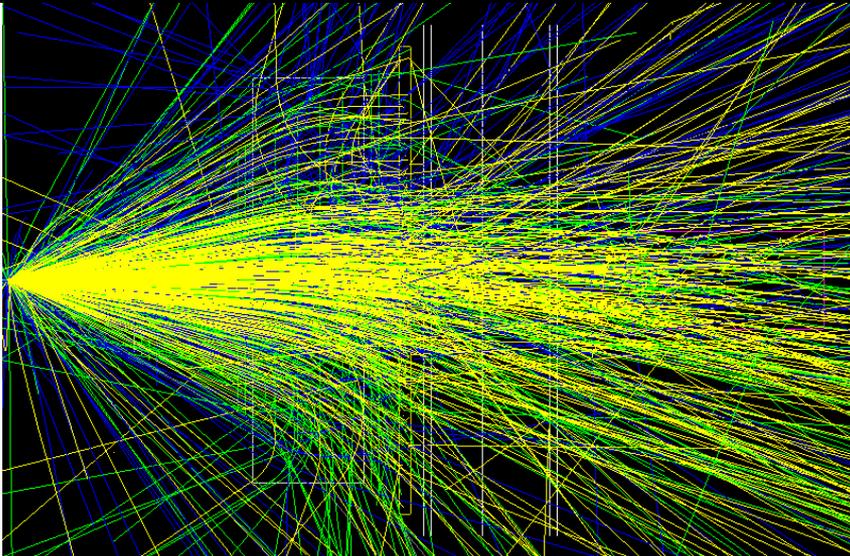

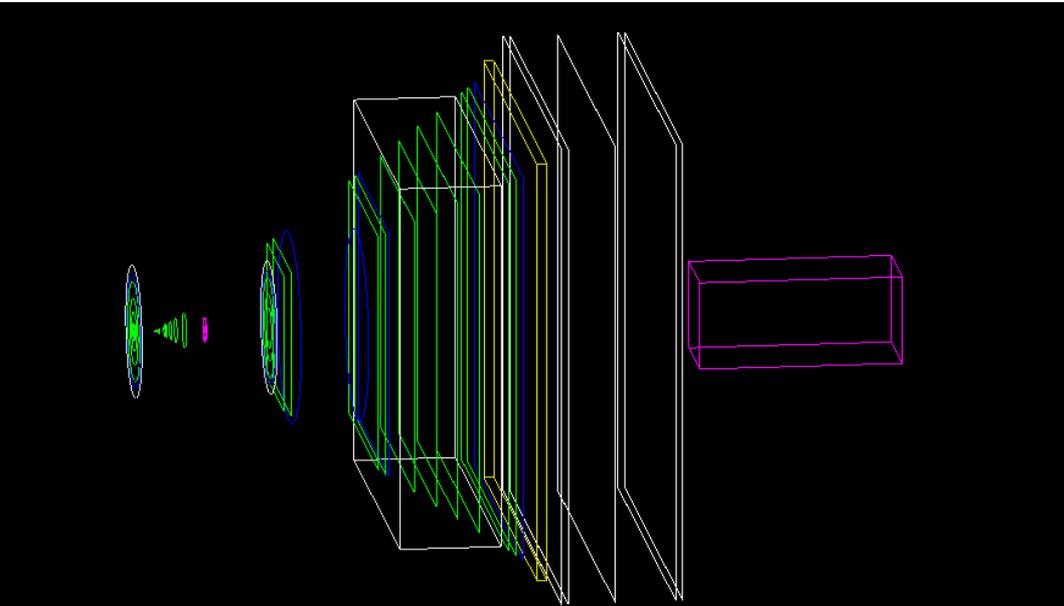

Dual radiator RICH
(HERMES type)

EMCAL (e, γ ID)

$PbWO_4$
 $15X_0$ (14cm)

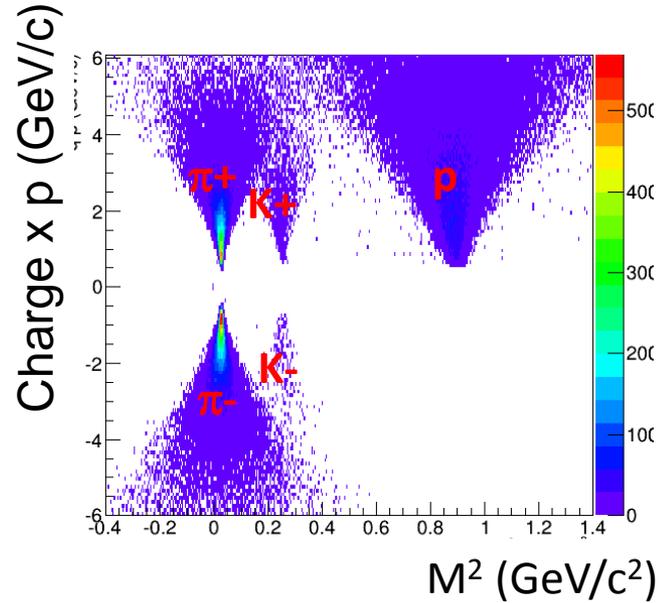

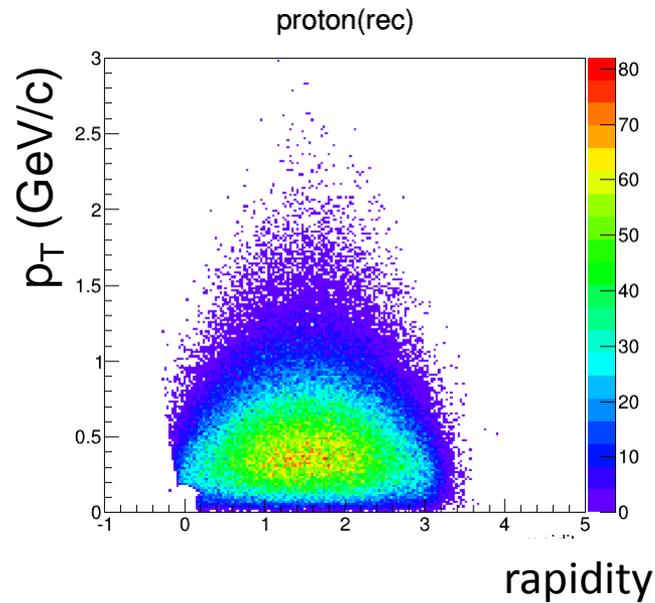

GEANT4 simulation

- JAM model
U+U (10A GeV)
- Full physics processes

Simulation results (Preliminary)

Momentum vs m^2 (dipole spectrometer)

Acceptance

| | |
|-------|-------|
| p | 97.2% |
| K | 91.7% |
| π | 82.9% |

TOF Resolution 50ps

Position resolution

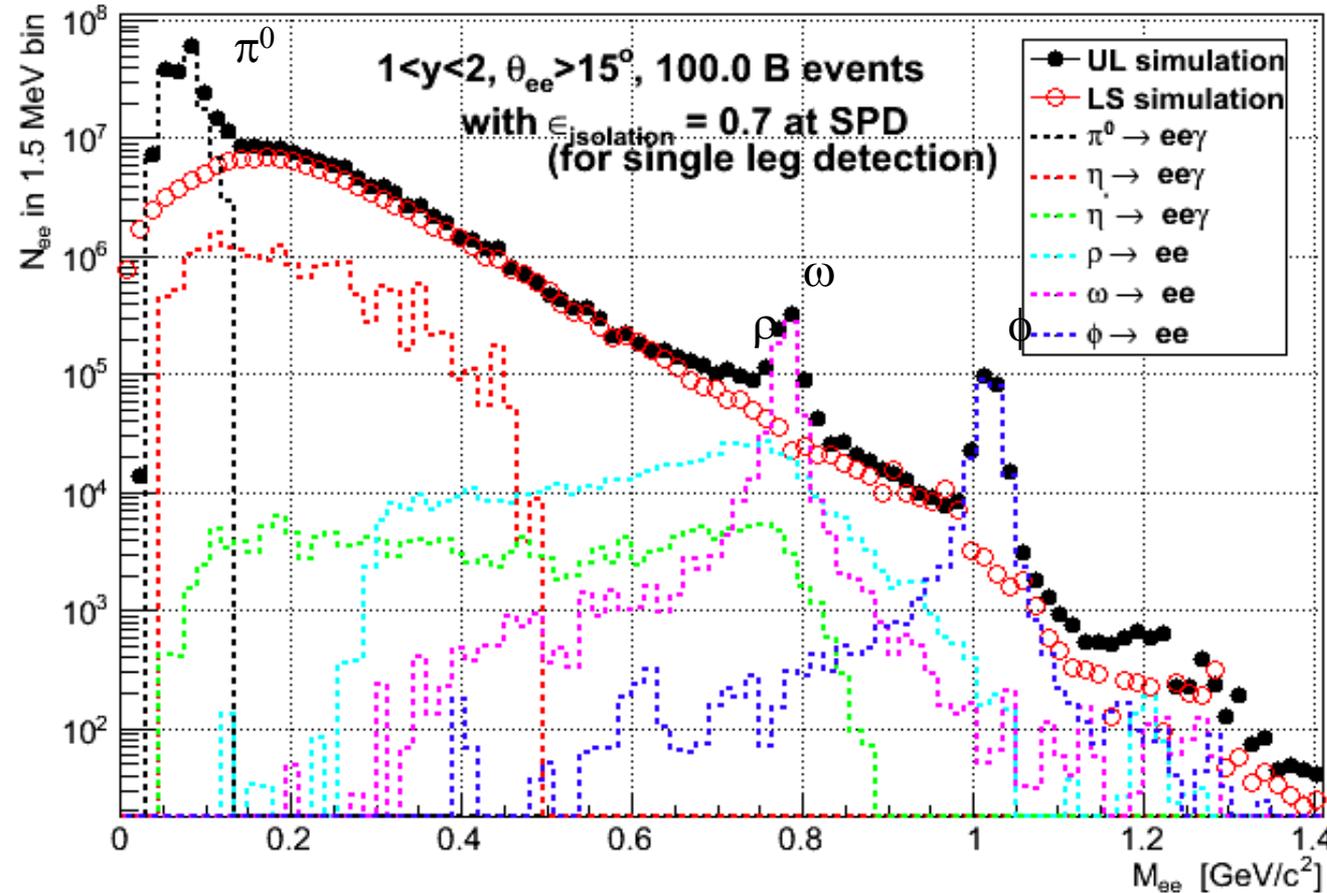

Silicon trackers : 14-23 μ m

GEM trackers: 0.2-0.5mm

$dp/p=1.3\%$ (solenoid)

1% * p (GeV/c) (dipole)

Simulated di-electron spectrum (preliminary)

Based on π^0 spectra of JAM
 Other hadrons mT-scaled
 $b < 1 \text{ fm}$ (0.25% centrality)
 Momentum resolution 2%
 Electron efficiency 50%

No detector response

10^{11} events
 $\Leftrightarrow 100 \text{ k events/sec}$
 $\times 1 \text{ month running}$

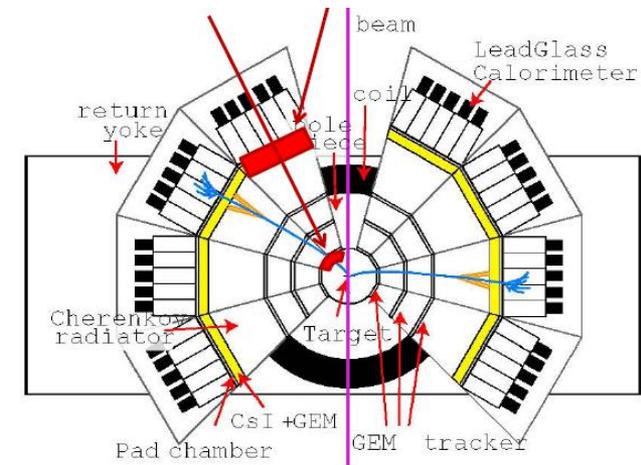

Calculations by T. Gunji and T. Sakaguchi

Summary

- A heavy ion program at J-PARC is under discussion
- Preliminary experimental setup has been designed
- Acceleration schemes are under design

Prospects

- Design of accelerators and experiments
 - A first complete design by Mar 2015 (White paper)
- Detector R & D
 - J-PARC E16 (electron/hadron in p+A)
 - J-PARC proton beams (10^{10} Hz)
 - Starting in 2016
- We wish international collaboration

Why heavy ion for hypernuclei ? (1)

Advantage of heavy ion to K-beam

- S=-3 hypernuclei

Only possible by HI collisions

- Double hypernuclei

Fragments from Ξ -C,N,O atoms (Emulsion) ${}^6\text{He}_{\Lambda\Lambda}$, ${}^{10}\text{Be}_{\Lambda\Lambda}$

${}^4\text{H}_{\Lambda\Lambda}$, ${}^5\text{H}_{\Lambda\Lambda}$, ${}^5\text{He}_{\Lambda\Lambda}$ may be much more produced by HI

- Neutron/proton rich hypernuclei

Light hypernuclei not produced by (γ, K^+) (π^-, K^+) , ...,

$n\text{nnn}\Lambda$, ${}^5\text{H}_{\Lambda}$, ${}^8\text{H}_{\Lambda}$, ${}^{10}\text{He}_{\Lambda}$, ${}^{11}\text{He}_{\Lambda}$, ${}^5\text{Li}_{\Lambda}$, ${}^{12}\text{Li}_{\Lambda}$, ${}^6\text{Be}_{\Lambda}$, ...

See Presentation by Masashi Kaneta

Centrality Trigger

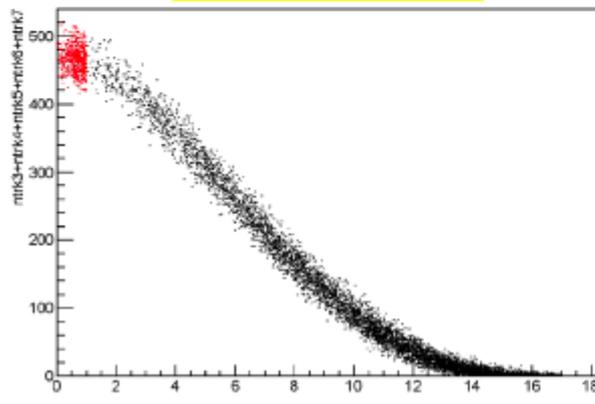

Narrow centrality cut taking advantage of high rate beams

- Ultra-central
- Many narrow Centrality ranges

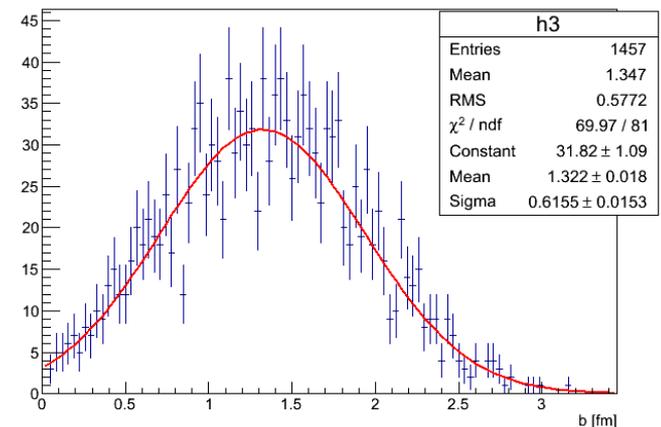

Triggering ($E_{\text{lab}} = 10\text{GeV}$ case)

- We would like to see very central events
 - assuming $b=17\text{fm}$ is maximum
 - $b<1\text{fm}$: $\sim 0.25\%$ central events (Marked as red points)
 - FYI, $b<0.5\text{fm} \rightarrow \sim 0.06\%$
- Impact parameter resolution $\sim 0.62\text{ fm}$

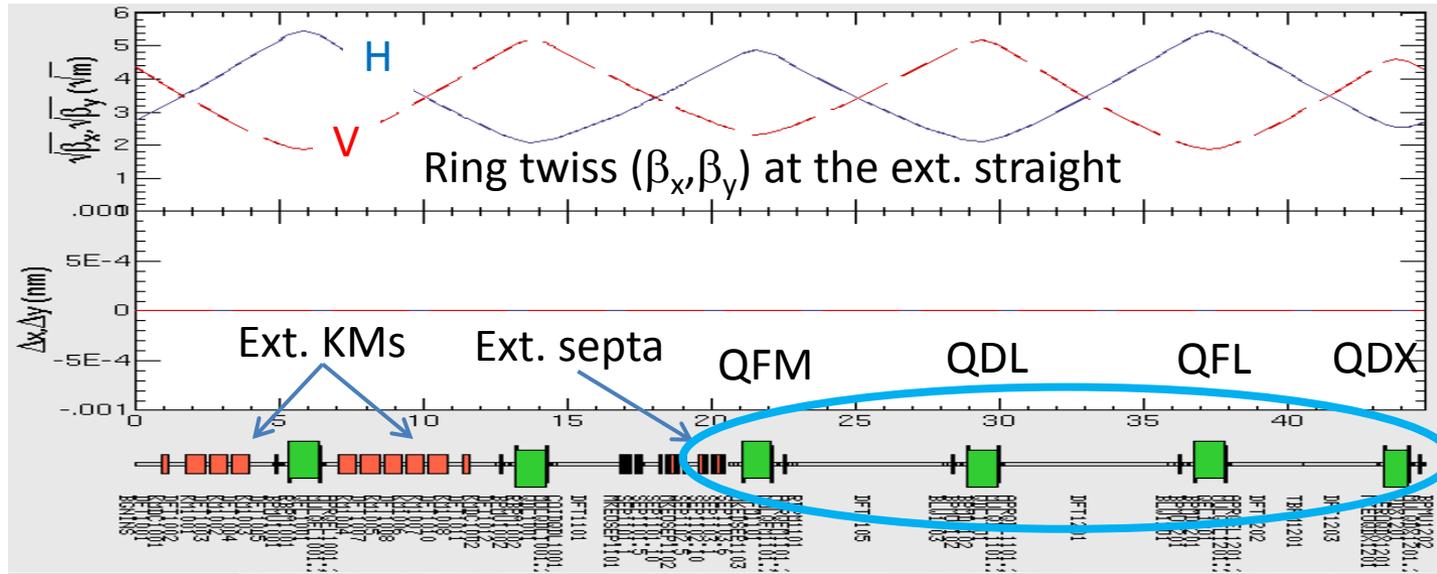

Ntrk($4<\theta<14^\circ$) vs b

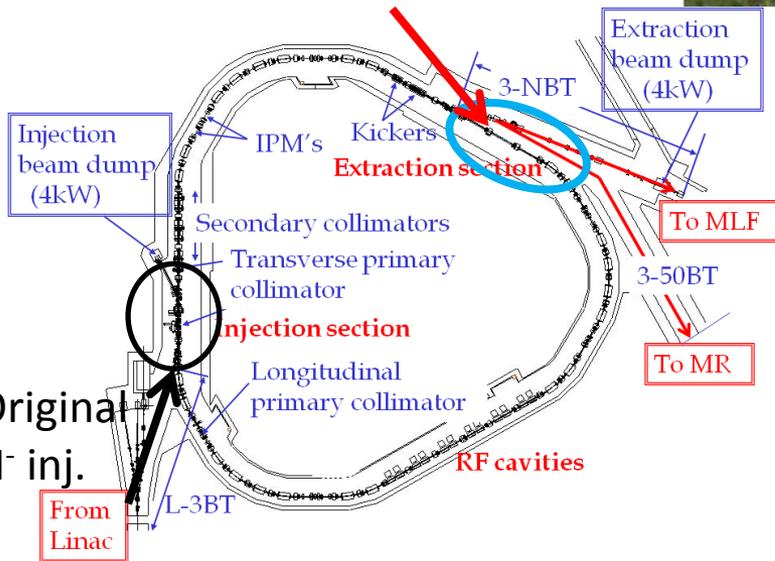

b dist. for $N_{\text{trk}}(4<\theta<14^\circ)>450$ only

5 GeV/c

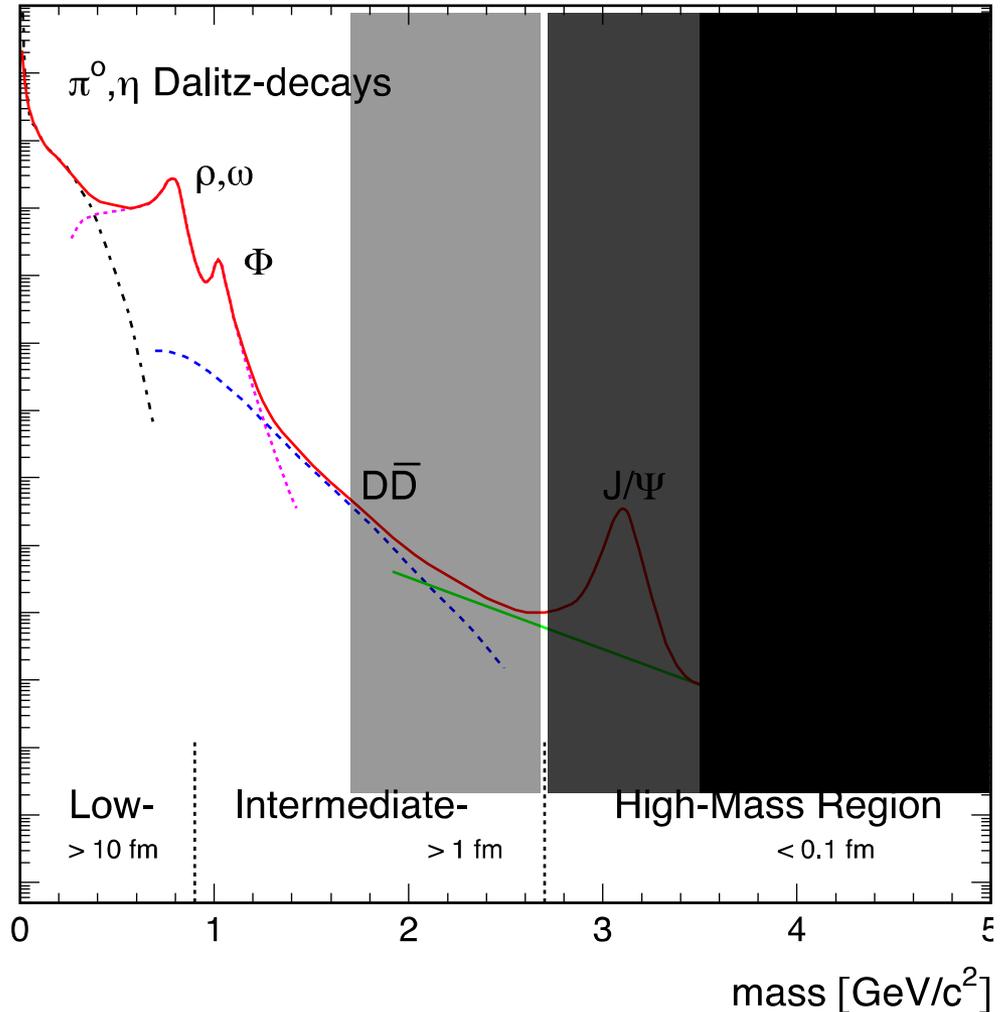

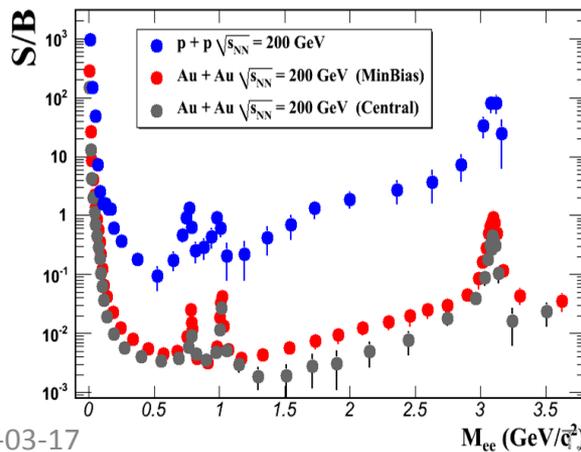

1 GeV/c

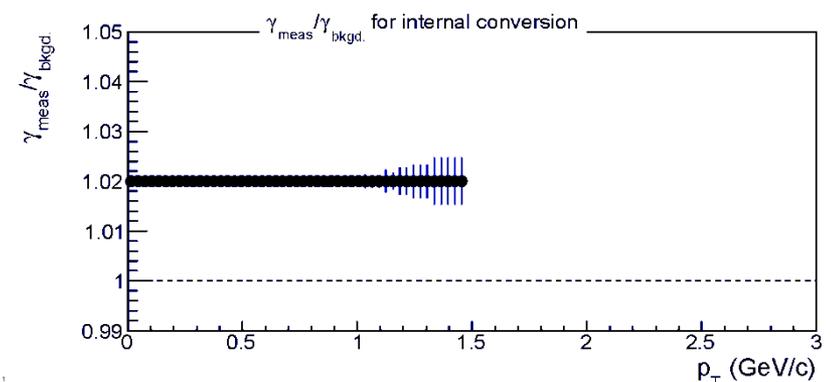

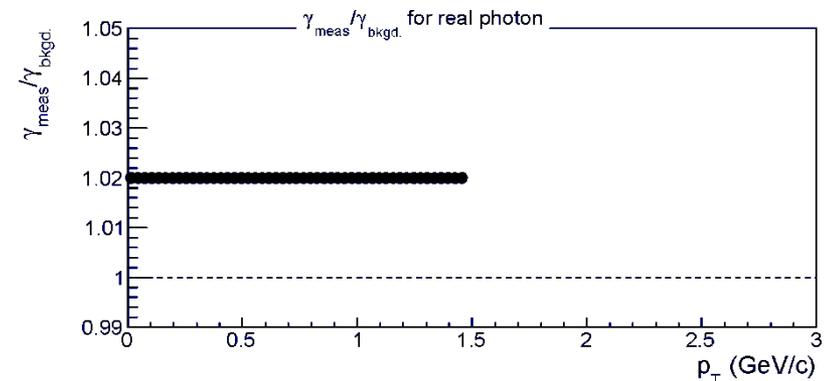

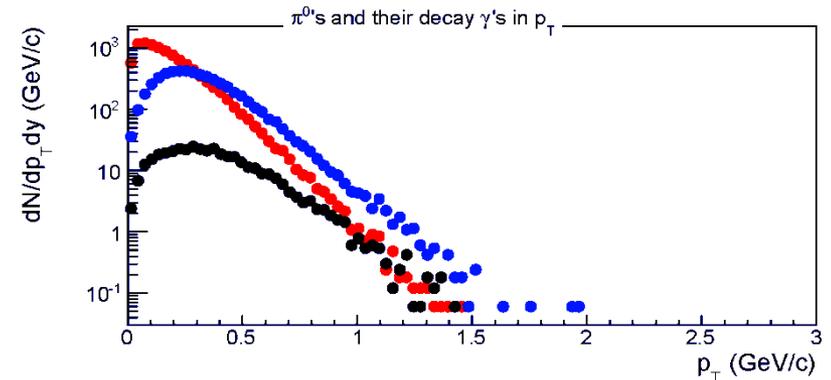

Dileptons at J-Parc energy

- Landscape for J-Parc
- Intermediate Mass Range
 - DDbar is very hard
 - QGP thermal radiation is on
- Low Mass Range
 - in-medium modification of vector mesons (link to chiral symmetry restoration)
 - Thermal radiation

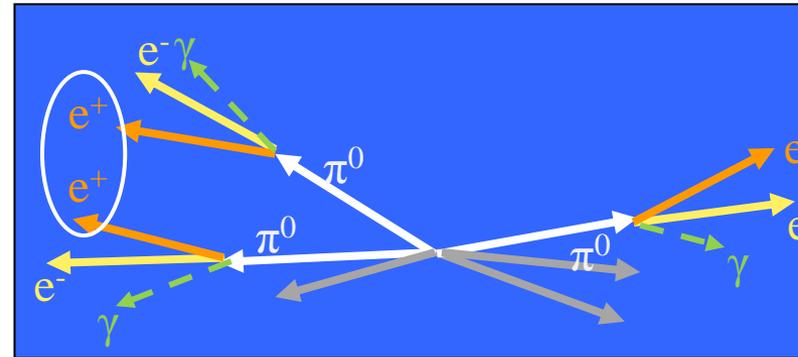

Photon feasibility study

- 0.1 T events $1 < \gamma < 2$, $b < 1\text{fm}$
- Blue: π^0 , Black: η , Red: decay photons from π^0 and η
- Direct photon signal is assumed to be 2% of background photons
- Statistical error only
- No hadron contamination, photon efficiency is taken into account.

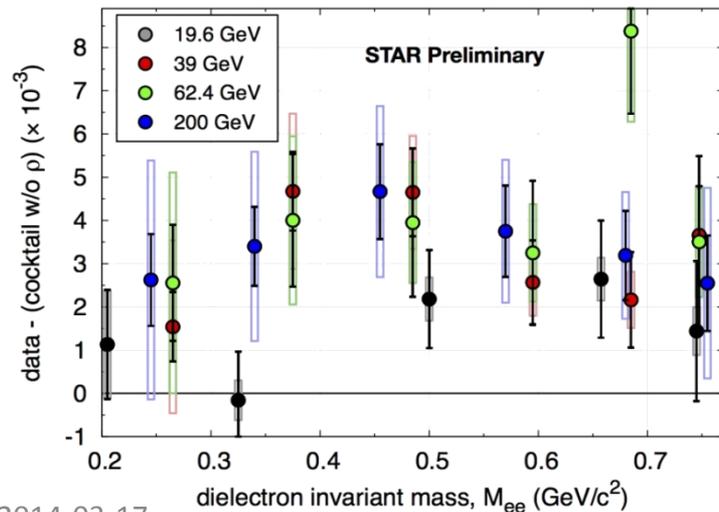

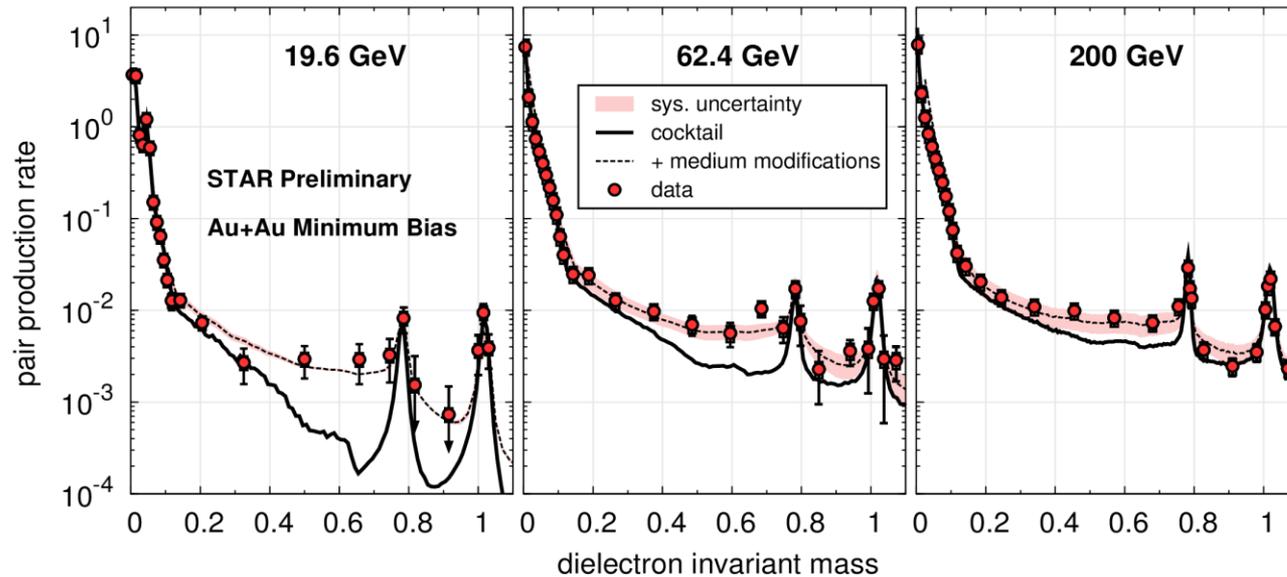

Electron feasibility study

- Huge background is a problem
- Very small jet-originated background
 - No cross-pair
 - No charm contribution
- Base on π^0 spectra obtained from JAM event generator
 - Other hadrons mT-scaled
- $1 < y < 2$ (in lab), $b < 1\text{fm}$ (0.25% centrality)
- 0.1T events (by one month running)

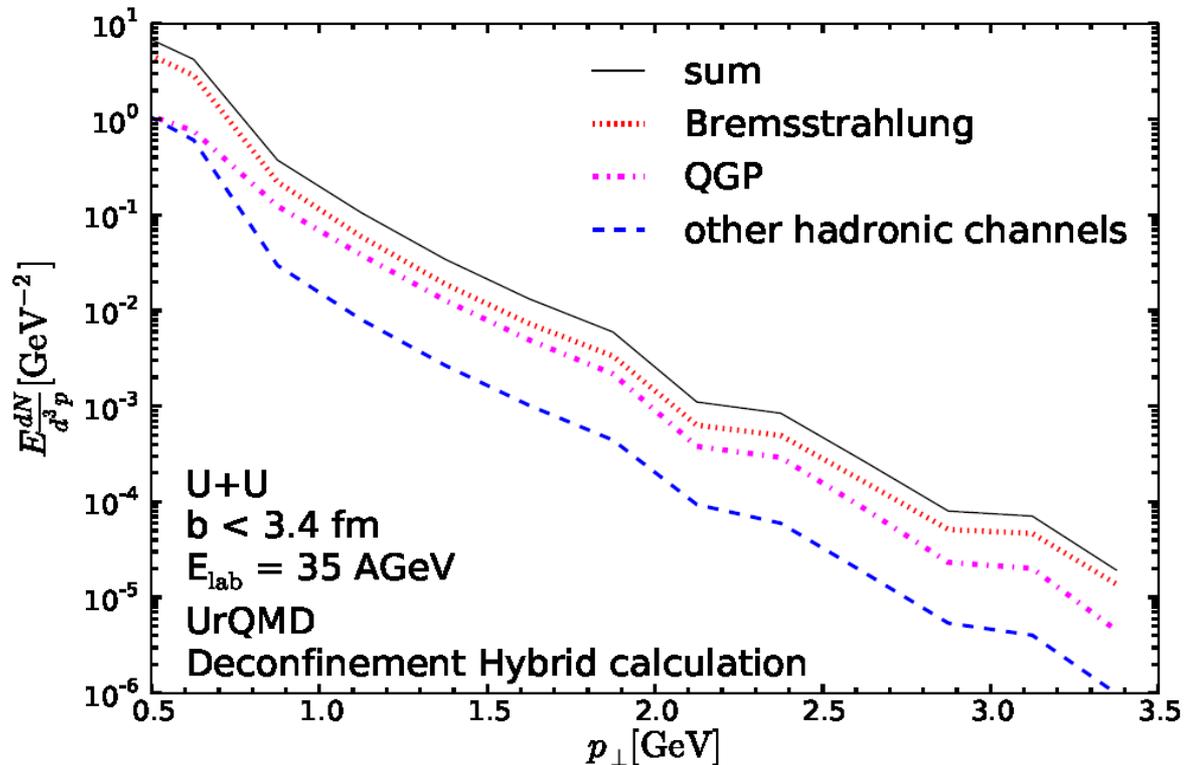

Beam Energy Scan of dielectrons

- LMR excess observed for all energies
- systematic measurement of excess
- Model calculations appear to provide robust description from RHIC down to SPS energies
- Measurements consistent with in-medium ρ broadening
 - expected to depend on total baryon density

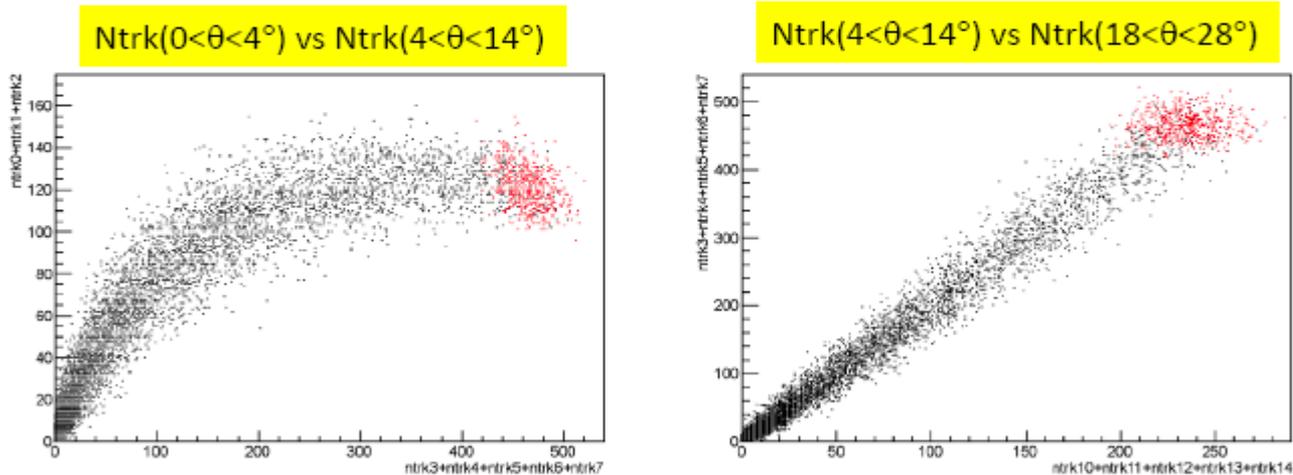

Photon calculation

- Using UrQMD, low p_T photons are calculated at FAIR energy
 - arxiv:1211.2401
 - Bremsstrahlung $\pi\pi \rightarrow \pi\pi\gamma$ is dominant
- Elliptic flow is estimated of the order of 1-2%

Centrality cut

- Correlating two Ntrks in different angle region
 - Possibility of higher selection power of very central events
 - $\text{Ntrk}(0 < \theta < 4^\circ)$ vs $\text{Ntrk}(4 < \theta < 14^\circ)$ looks good
 - Reds are $b < 1$ events
