PoS(ICHEP2012)078

Phenomenology Symposium 6.-8. May 2013

- I. Motivation and Introduction**
- II. Theoretical Status of QCD and Electroweak Corrections**
- III. Numerical Results**
- IV. Conclusions and Outlook**

- **WW/ZZ** is an important **irreducible background** to inclusive SM Higgs boson production.
- Gauge boson pair production provides an excellent opportunity to test **the non-abelian structure** of triple gauge boson couplings of the SM at high energies.
 - ↪ constraint on non-standard γWW and ZWW couplings.
 - ↪ Search for **anomalous triple and quartic couplings**.
- Backgrounds to **new physics searches**, i.e. leptons + \cancel{E}_T signatures.
 - ↪ **Pair production of supersymmetric particles**.

QCD Corrections to $V_1 V_2$ -pair production:

- NLO QCD corrections are available for full process including leptonic decays. [Dixon, Kunszt, Signer '99; Campbell, Ellis '99; De Florian, Signer '00]
- Results matched with parton showers and combined with soft-gluon resummation. [S. Frixione, B.R. Weber '06; P. Nason, G. Redolfi '06]
- QCD corrections dominated by tree-level $q\bar{q}$ annihilation channels. Significant contributions of the channels $gg \rightarrow V_1 V_2 \sim 10\%$ to LO, although formally at $\mathcal{O}(\alpha_s^2)$. [Dührssen et.al. '05; Glover, van der Bij '89; Kao, Dicus'91]

- By considering event selection for Higgs searches even corrections of 30% can be obtained. [Binoth et. al. '06]

EW corrections to gauge-boson pair production:

- Complete $\mathcal{O}(\alpha)$ corrections known to $pp \rightarrow W\gamma \rightarrow \ell\bar{\nu}\gamma + X$ in single pole approximation. [Accomando, Denner, Pozzorini '01; Accomando, Denner, Meier '05]
- Complete $\mathcal{O}(\alpha)$ corrections for on-shell Z bosons $pp \rightarrow Z\gamma$.
[Hollik, Meier '04]
- Complete $\mathcal{O}(\alpha)$ corrections for $pp \rightarrow Z\gamma \rightarrow \ell\ell\gamma + X$ in a single pole approximation. [Accomando, Denner, Meier '05]
- Complete $\mathcal{O}(\alpha)$ corrections for $pp \rightarrow WW, ZZ, WZ \rightarrow 4\ell + X$ in high energy and pole-approximation.
→ Large negative EW corrections at large transverse momentum.
[Accomando, Denner, Pozzorini '01; Accomando, Denner, Kaiser '04]
- NNLL effects at two loops for WW channel.
[Kühn, Metzler, Penin, Uccirati '11]

We have calculated the full one-loop corrections to gauge-boson pair production at the LHC.

[A. Bierweiler, T. Kasprzik, J.H. Kühn, S. Uccirati '12; A. Bierweiler, T. Kasprzik, J.H. Kühn'12]

Default cuts: $p_{T,W^\pm} > 15 \text{ GeV}$, $|y_{W^\pm}| < 2.5$

MSTW2008LO PDFs [Martin et al. 2009]

- assume $\int \mathcal{L} dt = 200 \text{ fb}^{-1} \Rightarrow 1000 \text{ WW events with } M_{WW} > 2 \text{ TeV}$
- rapidly increasing admixture of $\gamma\gamma \rightarrow WW$, since $\sigma(\gamma\gamma \rightarrow WW) \xrightarrow{\hat{s} \rightarrow \infty} 8\pi\alpha^2/M_W^2$
- **sizable (up to -30%) negative EW corrections**

No compensation between $\gamma\gamma \rightarrow W^+W^-$ and weak corrections!

\Rightarrow Different angular distributions

- $\gamma\gamma \rightarrow W^+W^-$:
strong enhancement in forward and backward directions
- **weak corrections:**
negative Sudakov Logarithms for large \hat{s} and \hat{t}
 \Rightarrow negative corrections for large scattering angles

\Rightarrow Implications for $d\sigma/d\Delta y_{WW}$ with $\Delta y_{WW} = y_{W^+} - y_{W^-}$

(for fixed M_{WW} this corresponds to the angular distribution in the WW -rest frame)

High energy cuts: $p_{T,W^\pm} > 15 \text{ GeV}$, $|y_{W^\pm}| < 2.5$, $M_{WW} > 1 \text{ TeV}$

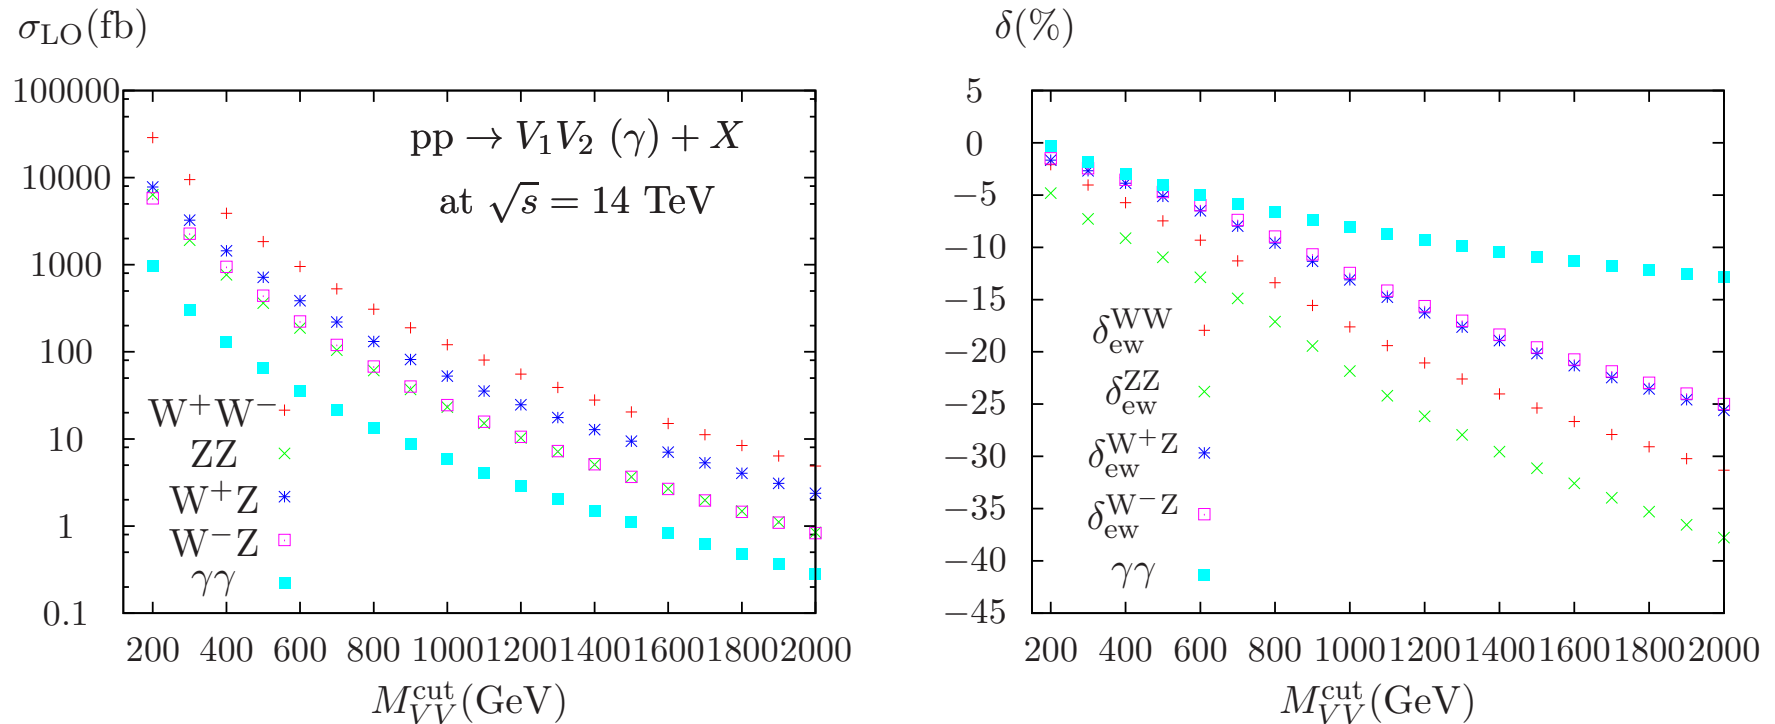

MSTW2008LO PDFs [Martin et al. 2009]

- WW production dominated by small scattering angles
- drastic forward-backward peaking of $\gamma\gamma \rightarrow WW$
- drastic distortion of angular distribution
- $\Sigma\delta$ varies from -30% and $+45\%$ for $M_{WW} > 1 \text{ TeV}$

Default cuts: $p_{T,V} > 15 \text{ GeV}$, $|y_V| < 2.5$

MSTW2008LO PDFs [Martin et al. 2009]

- Largest EW corrections to ZZ production and small EW corrections for $\gamma\gamma$ production
- EW corrections to W^+Z -production coincide with those to W^-Z -production at the percent level as a consequence of the identical corresponding unpolarized partonic cross section.

Conclusion and Outlook:

- **Understanding of gauge boson pair production processes crucial at the LHC:**
 - Understand SM at high energies
 - Understand background to Higgs- and BSM physic searches
- **We have computed the full EW corrections to V-pair production at the LHC:**
 - Small corrections to the total cross section
 - **But:** Sizable negative corrections at large transverse momenta and high invariant mass M_{VV}
 - W-pair production: significant contribution of photon-induced channel at large scattering angles
- **Future work:**
 - Leptonic decays of the vector bosons should be included

Conclusion and Outlook:

- **Understanding of gauge boson pair production processes crucial at the LHC:**
 - Understand SM at high energies
 - Understand background to Higgs- and BSM physic searches
- **We have computed the full EW corrections to V-pair production at the LHC:**
 - Small corrections to the total cross section
 - **But:** Sizable negative corrections at large transverse momenta and high invariant mass M_{VV}
 - W-pair production: significant contribution of photon-induced channel at large scattering angles
- **Future work:**

EW Corrections at High Energies:

High-energy limit:

$$\hat{s} \sim |\hat{t}| \sim |\hat{u}| \gg M^2 := M_W^2 \simeq M_Z^2 \sim M_H^2 \sim M_t^2 \gg m_f^2 \gg \underbrace{m_\gamma^2}_{\text{IR-regulator}}$$

↪ bosons are produced at large p_T

- EW corrections are enhanced by **universal large logarithms** that originate from **mass singularities** $\text{Log}(s/M^2)$ and grow with energy:

$$\underbrace{\alpha^L \text{Log}^{2L}(s/M^2)}_{\text{LL}}, \quad \underbrace{\alpha^L \text{Log}^{2L-1}(s/M^2)}_{\text{NLL}}, \quad \dots$$

- Corrections are of $\sim -50\%$ at $p_T = 1\text{TeV}$ (WW production)

Note: Change of sign going from LL to NLL (to NNLL etc.)

↪ **substantial cancellations are possible!**

We have calculated the full one-loop corrections to W-pair production at the LHC. [A. Bierweiler, T. Kasprzik, J.H. Kühn, S. Uccirati '12]

- Partonic leading order contributions at $\mathcal{O}(\alpha^2)$:

- Photon-induced contributions at $\mathcal{O}(\alpha^2)$:

- MSTW2004qed PDF set is adopted [Martin et al. 2005]
- Potentially large contribution at large invariant masses

NLO Electroweak Corrections:

Virtual Electroweak Corrections:

- **Renormalization:**

- masses and fields renormalized in the **on-shell** scheme
- We work in G_μ scheme: renormalization of α_{G_μ} is defined through the Fermi constant related to the muon life time

$$\alpha_{G_\mu} = \frac{\sqrt{2}G_\mu M_W^2 s_w^2}{\pi} = \frac{\alpha(0)}{1 - \Delta r}$$

Δr includes the corrections to muon lifetime not contained in QED-improved Fermi model

\Rightarrow The EW corrections are independent of logarithms of the light quark masses.

Thomson-limit: (zero momentum transfer)

$$\delta Z_e|_{\alpha(0)} = \frac{1}{2} \frac{\partial \Sigma_T^{\gamma\gamma}(k^2)}{\partial k^2} \Big|_{k^2=0} - \frac{s_w}{c_w} \frac{\partial \Sigma_T^{\gamma\gamma}(0)}{M_Z^2}$$

$\Sigma_T^{\gamma\gamma}(k^2)$ is transverse part of $\gamma\gamma$ self-energy with momentum transfer k .
 \Rightarrow charge renormalization constant contains logarithms of light fermion masses including large corrections proportional to $\sim \alpha \log(m_f^2/\hat{s})$

G_μ scheme: The transition from $\alpha(0)$ to G_μ is ruled by the weak corrections to muon decay Δr :

$$\alpha(G_\mu) = \frac{\sqrt{2} G_\mu M_W^2 s_w^2}{\pi} = \alpha(0)(1 + \Delta r) + \mathcal{O}(\alpha^3)$$

$$\Rightarrow \delta Z_e|_{\alpha(G_\mu)} = \delta Z_e|_{\alpha(0)} - \frac{\Delta r}{2}$$

\Rightarrow large fermion mass logs are resummed in G_μ scheme

\Rightarrow the lowest order cross section in G_μ parametrization absorbs large universal corrections to SU(2) gauge coupling introduced by ρ parameter

IR Singularities:

- **Virtual Corrections:**

- Soft singularities arise due to soft photons
- Initial-state collinear singularities arise due to collinear photon radiation off initial-state quarks
- introduce small **quark mass** m_f and **photon mass** m_γ to regularize divergences
 - results contain unphysical $\log(m_f)$ and $\log(m_\gamma)$

- **Real Radiation:**

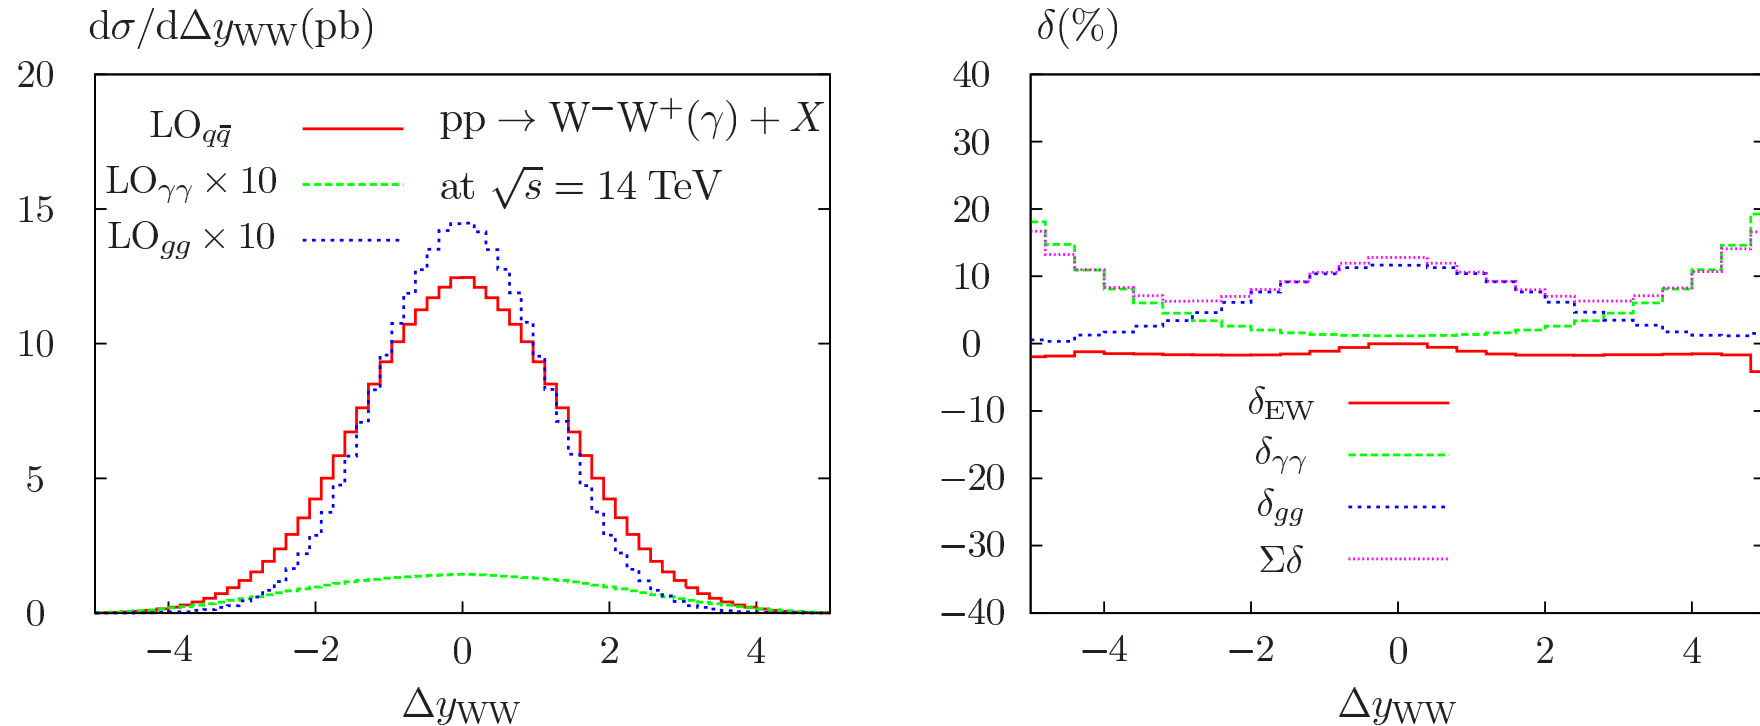

IR divergent (also regularized by m_γ and m_f), compensated partially by virtual corrections. Remaining collinear singularities have to be absorbed in PDFs.

→ renormalization of PDFs is required

⇒ **Apply phase-space slicing for numerically stable evaluation of phase-space integral**

Default cuts: $p_{T,W^\pm} > 15 \text{ GeV}$, $|y_{W^\pm}| < 2.5$

MSTW2008LO PDFs [Martin et al. 2009]

- Cross section dominated by central events with W-pair of low invariant mass and relatively isotropic distributions
- stronger preference of gg -induced process for small Δy_{WW}
- enhancement of the $\gamma\gamma$ process for small scattering angles

Default cuts: $p_{T,V} > 15 \text{ GeV}$, $|y_V| < 2.5$

MSTW2008LO PDFs [Martin et al. 2009]

Default cuts: $p_{T,V} > 15 \text{ GeV}$, $|y_V| < 2.5$

MSTW2008LO PDFs [Martin et al. 2009]

Default cuts: $p_{T,V} > 15$ GeV, $|y_V| < 2.5$
 MSTW2008LO PDFs [Martin et al. 2009]

Technicalities:

Two different approaches to calculate **virtual corrections** and **bremsstrahlung amplitudes** to $pp \rightarrow VV'$:

Virtual corrections and **bremsstrahlung amplitudes** computed in the **QGRAF** and **FORM** framework:

- **QGRAF**: [Nogueira]
generation of Feynman diagrams
- **FORM**: [Vermaseren]
implementation of Feynman rules, reconstruction of Dirac structures, introduction of tensor coefficients and their algebraical reduction to scalar integrals, analytical calculation of squared amplitudes, generation of **FORTRAN** code

Virtual corrections computed in the **FeynArts/FormCalc/LoopTools(FF)** framework:

- **FeynArts - 3.5**: [Küblbeck et al '90]
automatic generation of diagrams, calculation of amplitudes
- **FormCalc - 6.1**: [Hahn et al '99]
introduction of tensor coefficients; analytical calculation of squared amplitudes; spin-, colour- and polarization sums; generation of **FORTRAN** code
- **LoopTools - 2.5**: [Vermaseren '90]
numerical Passarino-Veltman reduction within **Fortran**;

Numerically-stable evaluation of scalar-integrals done within **LoopTools - 2.5**.

Numerical phase-space integration done within Fortran using the **Vegas** algorithm.
