

Neutron-Proton-Conversion Acceleration at Subphotospheres of Relativistic Outflows

Thursday 29 August 2013 15:36 (24 minutes)

We study a type of particle acceleration that operates via neutron-proton conversion (NPC) in in-elastic nuclear collisions. This mechanism can be expected for relativistic shocks at subphotospheres if relativistic outflows contain neutrons. Using a test-particle approximation, we numerically calculate the energy spectrum and the efficiency of accelerated particles, and show that a good energy fraction of the nucleons may be accelerated. The NPC acceleration may especially be relevant if the shock is radiation-mediated, and it would enhance the detectability of GeV-TeV neutrinos.

Presenter: KASHIYAMA, Kazumi

Session Classification: High-energy gamma rays
