But a third family of particles was going to be discovered

SLAC (Marty Perl)

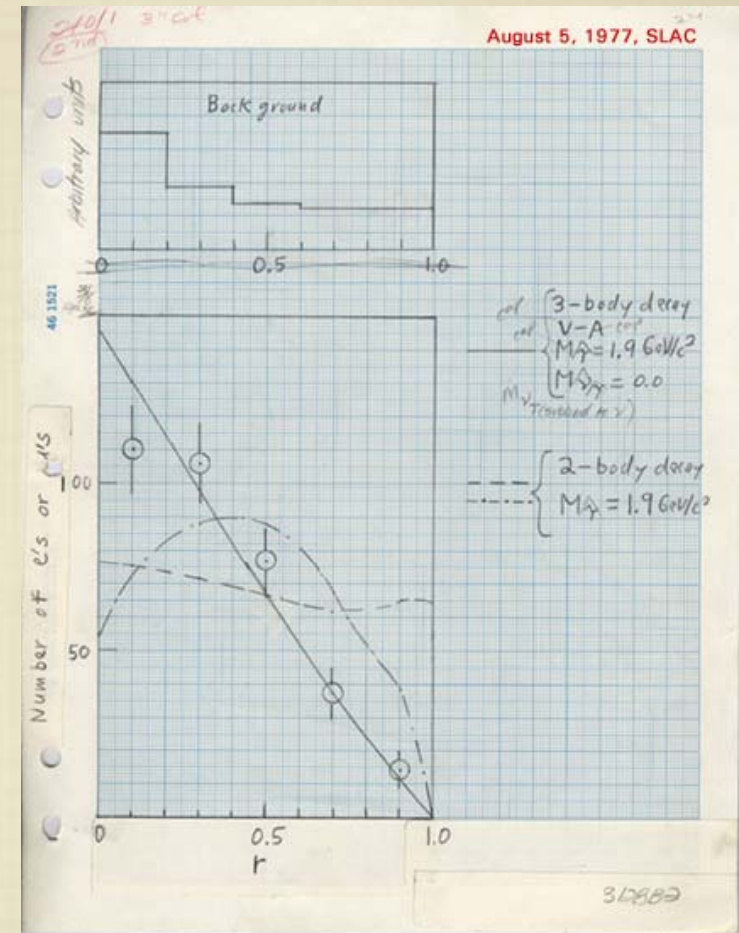

A new 'heavy electron' with $3500 \times m_e$

... who ordered that?

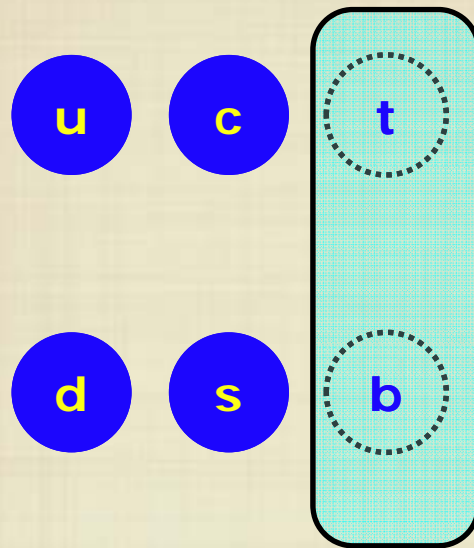

THERE MUST BE A WHOLE NEW FAMILY

another neutrino (the 'tau neutrino'),
and two more quarks ('top' and 'bottom')

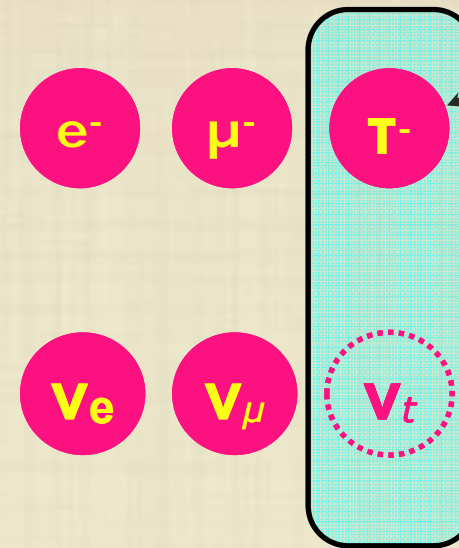

Marty Perl's logbook page

The search for the other family members started

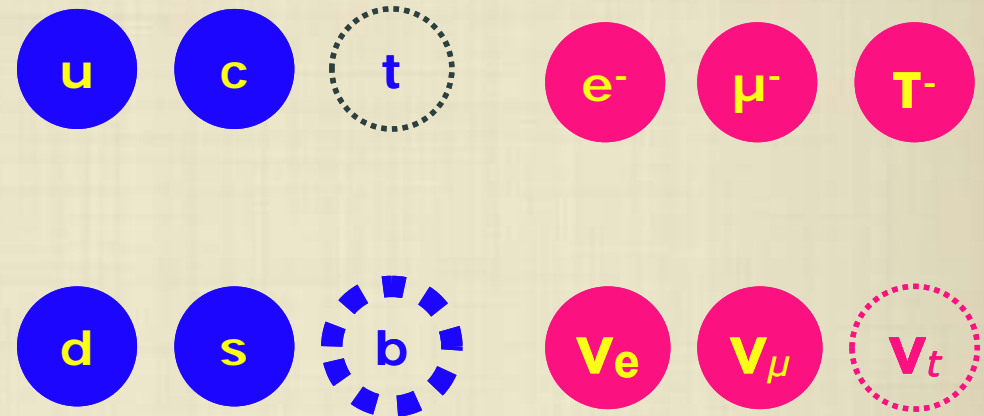

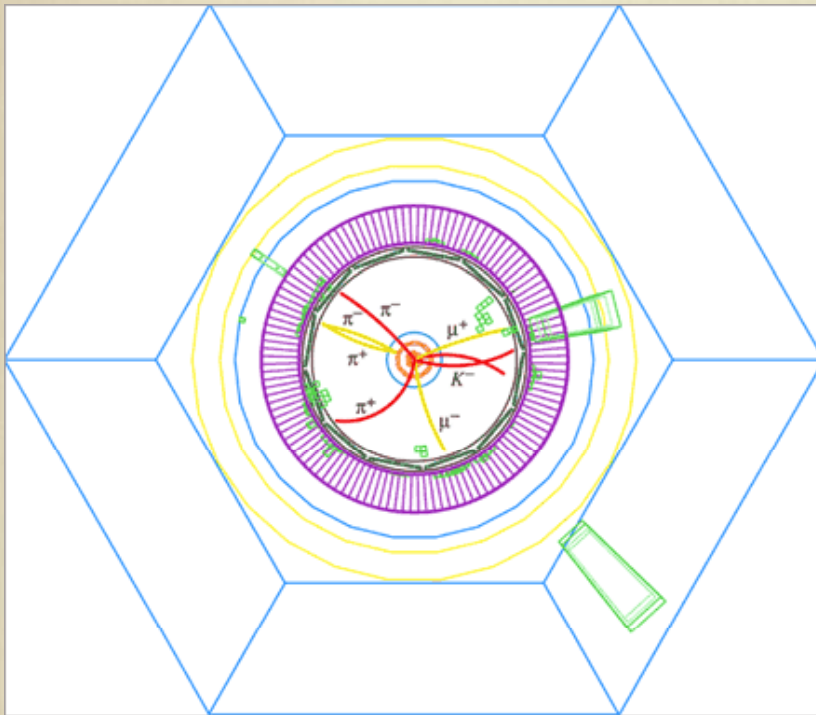

Quarks

Leptons

Discovery of the 'Bottom' Quark (Fermilab)

Quarks

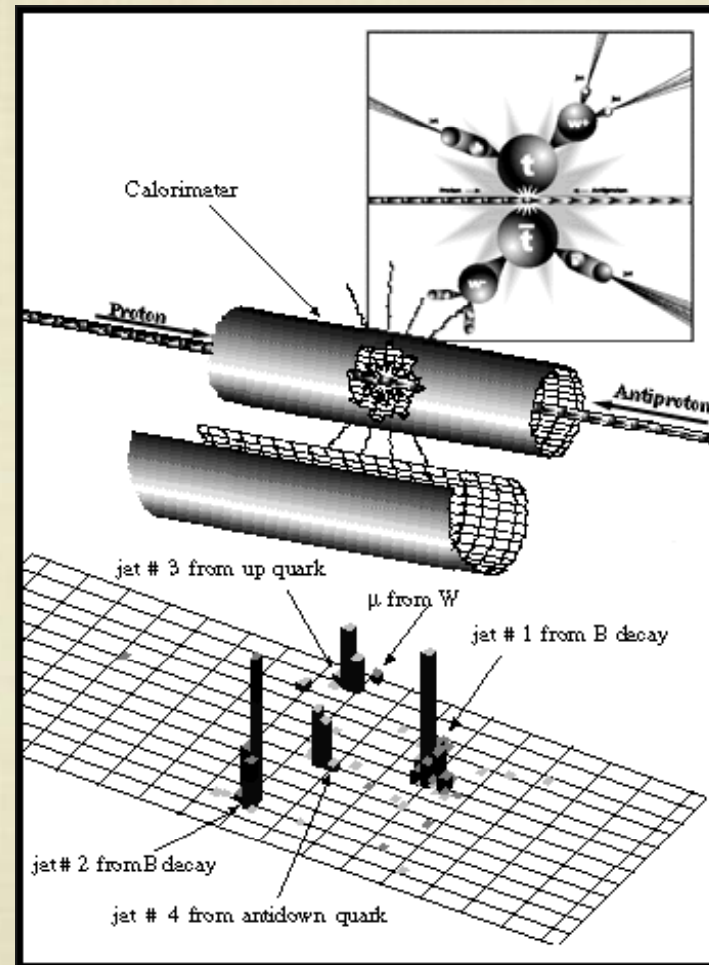

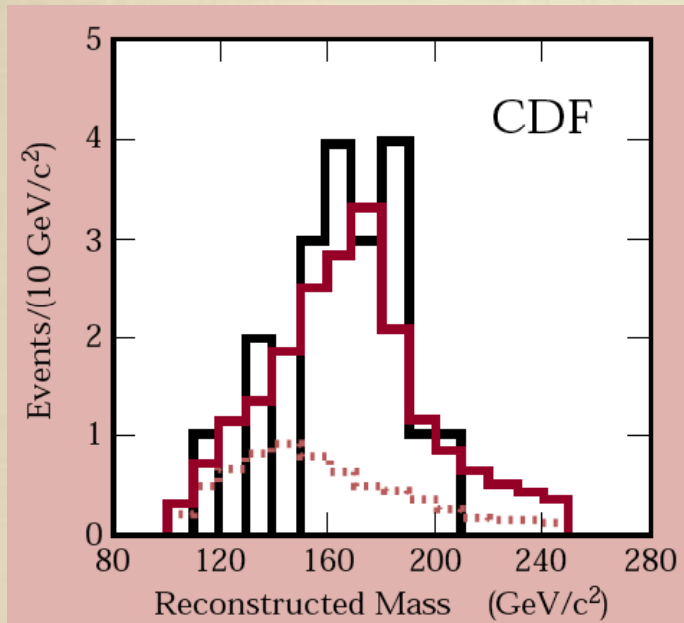

Leptons

In 1977 physicists discovered a new meson called the Upsilon at the Fermi National Accelerator Laboratory.

This meson was immediately recognized as being composed of a bottom/anti-bottom quark pair.

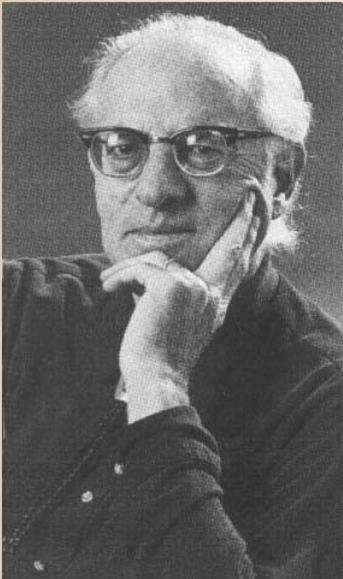

The bottom quark had charge $-1/3$ and a mass of roughly 5 GeV.

"Muon" neutrino

Two different kinds of neutrinos exist: electron- and muon-neutrino

OBSERVATION OF HIGH-ENERGY NEUTRINO REACTIONS AND THE EXISTENCE OF TWO KINDS OF NEUTRINOS*

G. Danby, J-M. Gaillard, K. Goulianos, L. M. Lederman, N. Mistry,
M. Schwartz,[†] and J. Steinberger[†]

Columbia University, New York, New York and Brookhaven National Laboratory, Upton, New York

(Received June 15, 1962)

In the course of an experiment at the Brookhaven AGS, we have observed the interaction of high-energy neutrinos with matter. These neutrinos were produced primarily as the result of the decay of the pion:

$$\pi^{\pm} \rightarrow \mu^{\pm} + (\nu/\bar{\nu}). \quad (1)$$

It is the purpose of this Letter to report some of the results of this experiment including (1) demonstration that the neutrinos we have used pro-

duce μ mesons but do not produce electrons, and hence are very likely different from the neutrinos involved in β decay and (2) approximate cross sections.

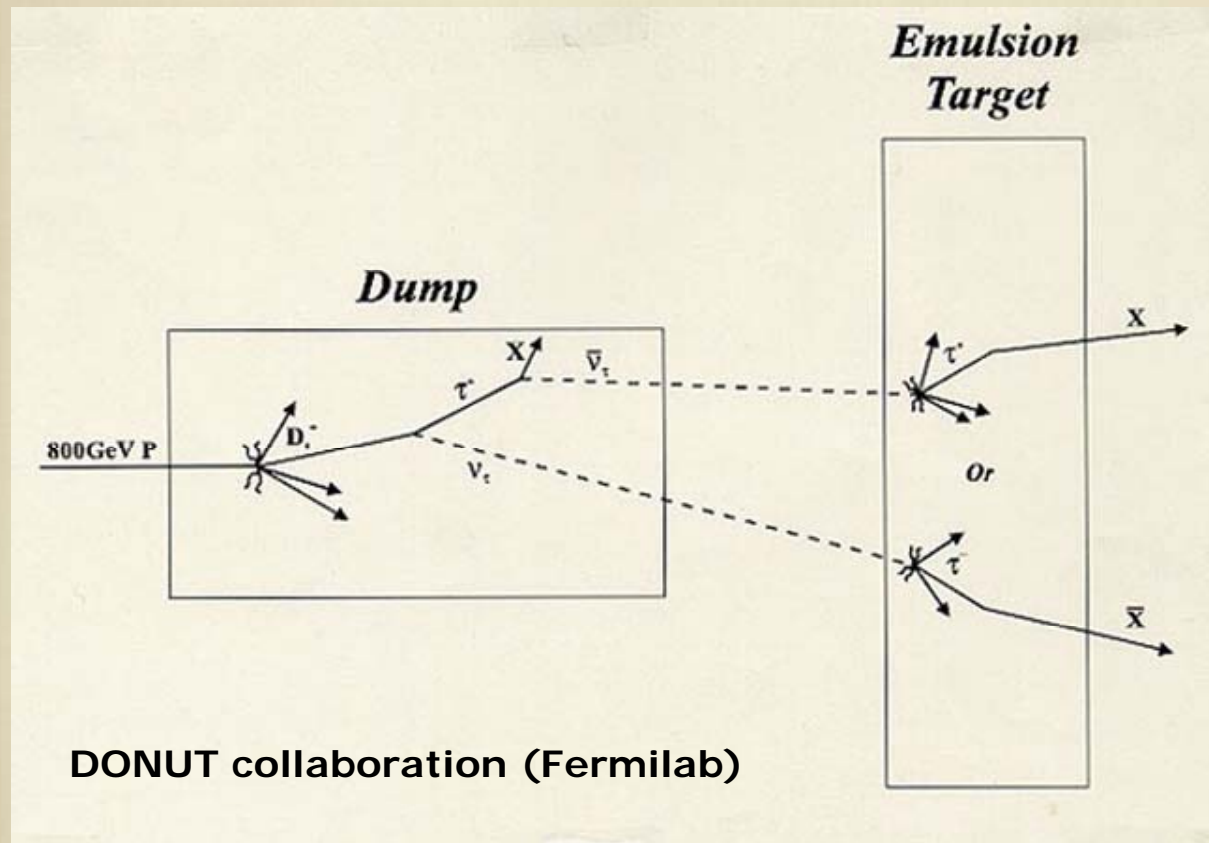

Behavior of cross section as a function of energy. The Fermi theory of weak interactions which works well at low energies implies a cross section for weak interactions which increases as phase space. Calculation indicates that weak interacting cross sections should be in the neigh-

Jack Steinberger, HST 2002

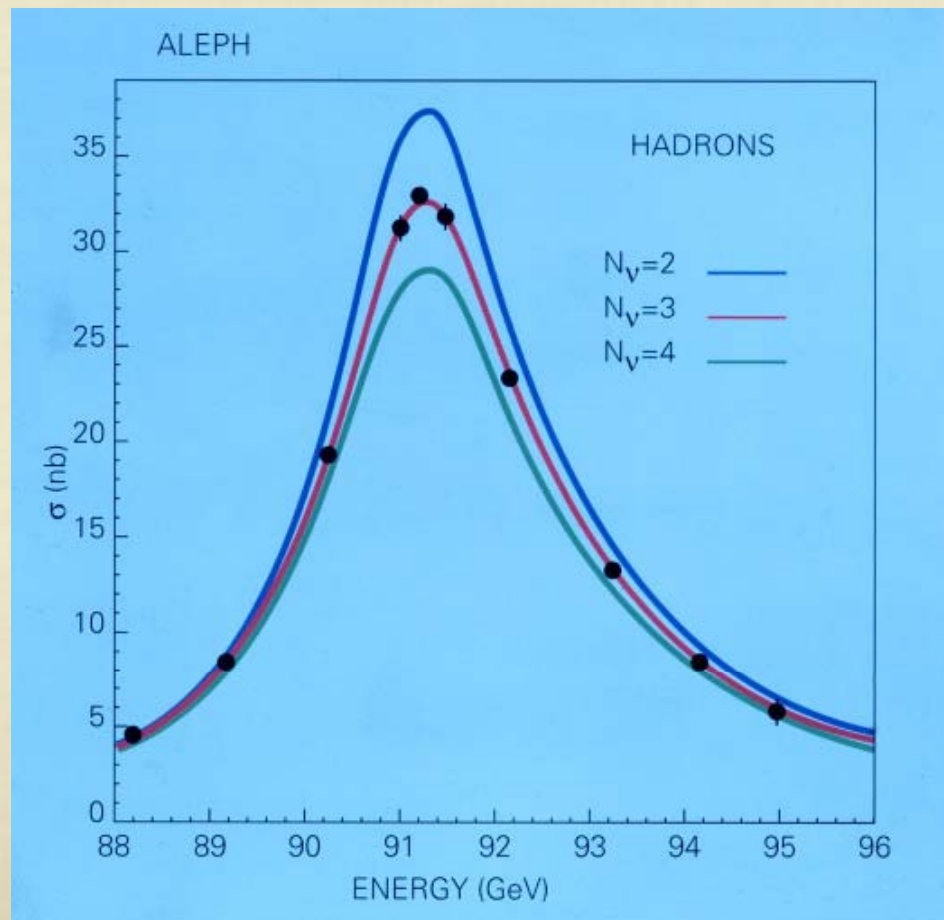

Do neutrinos have a mass? Can they transform into each other ('oscillations') ?

Discovery of the tau neutrino

3 generations of neutrinos

LEP measures the decay width of the Z^0 particle

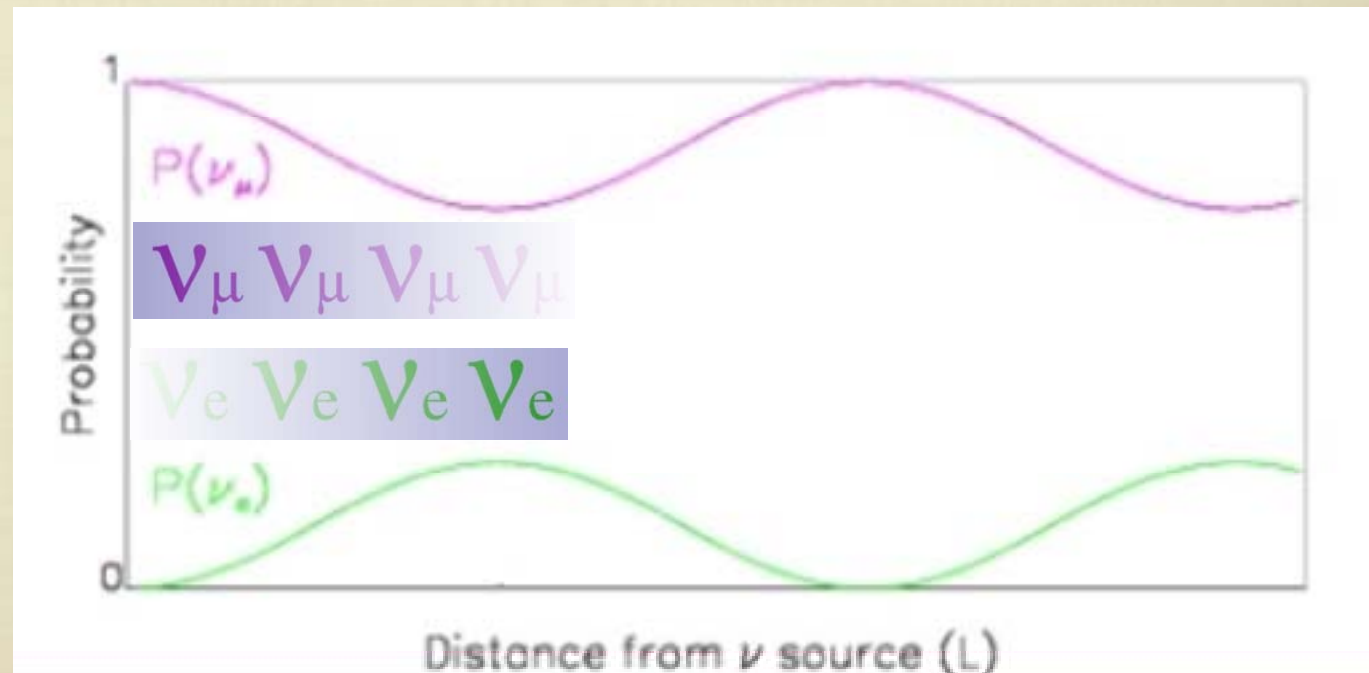

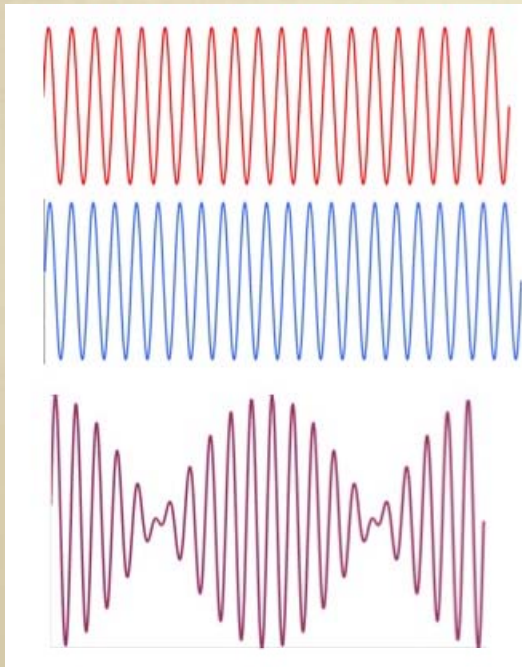

Do neutrinos have a rest mass ?

Neutrino oscillations

... like musical beats

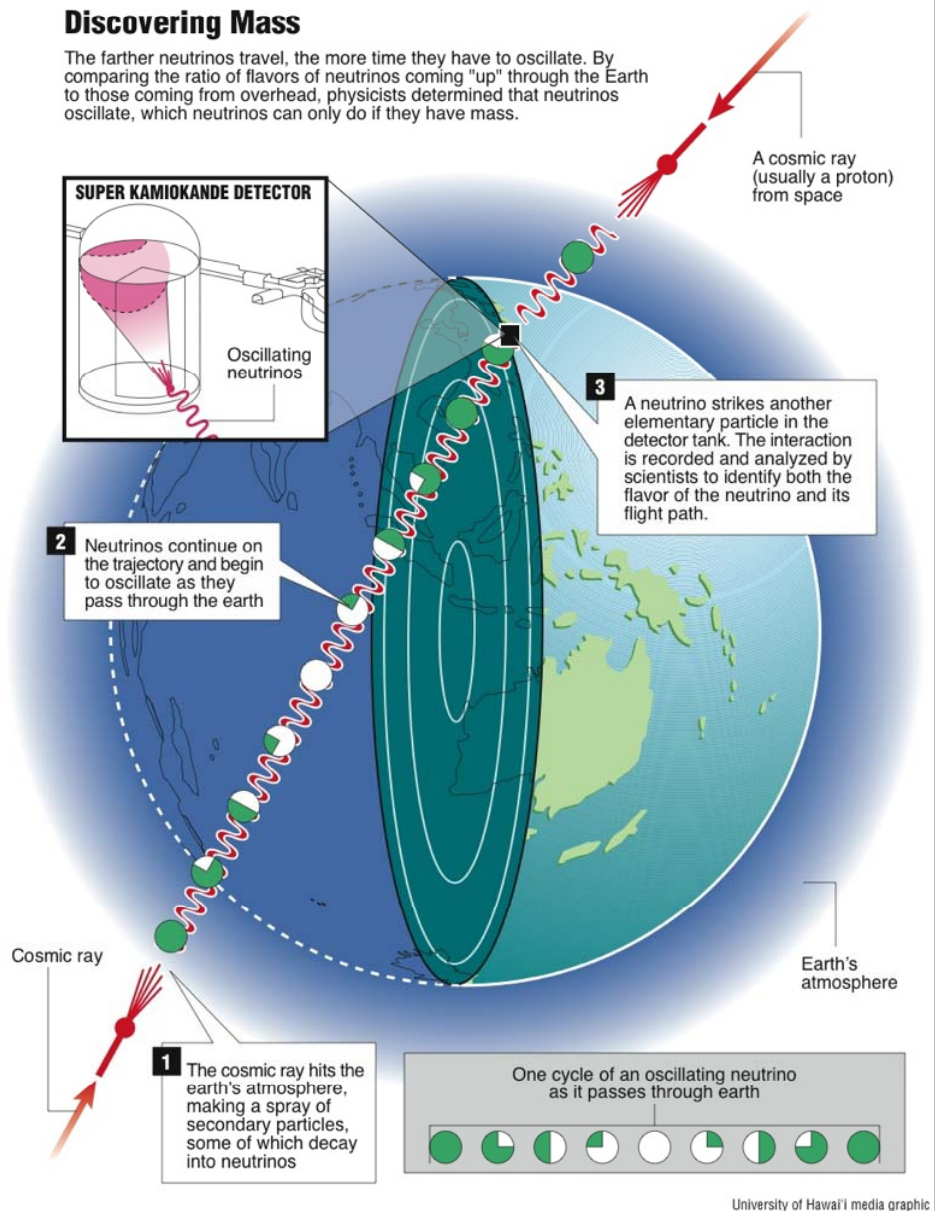

If masses are not too different,
frequencies are quite similar

Neutrino oscillations discovery

Discovering Mass

The farther neutrinos travel, the more time they have to oscillate. By comparing the ratio of flavors of neutrinos coming "up" through the Earth to those coming from overhead, physicists determined that neutrinos oscillate, which neutrinos can only do if they have mass.

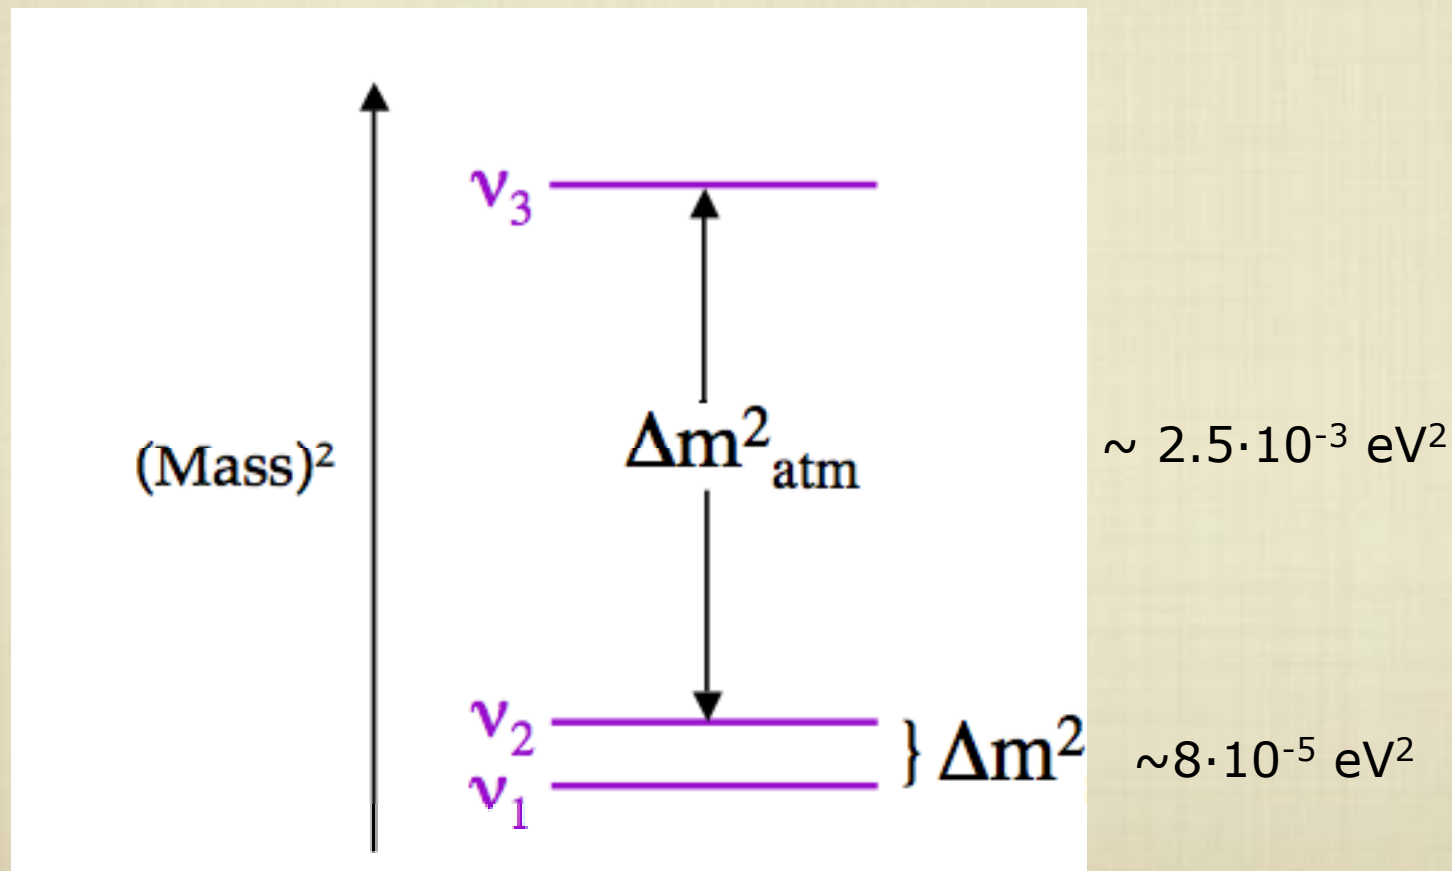

Muon neutrinos are produced by cosmic rays in the upper atmosphere

Deficit of muon neutrinos:

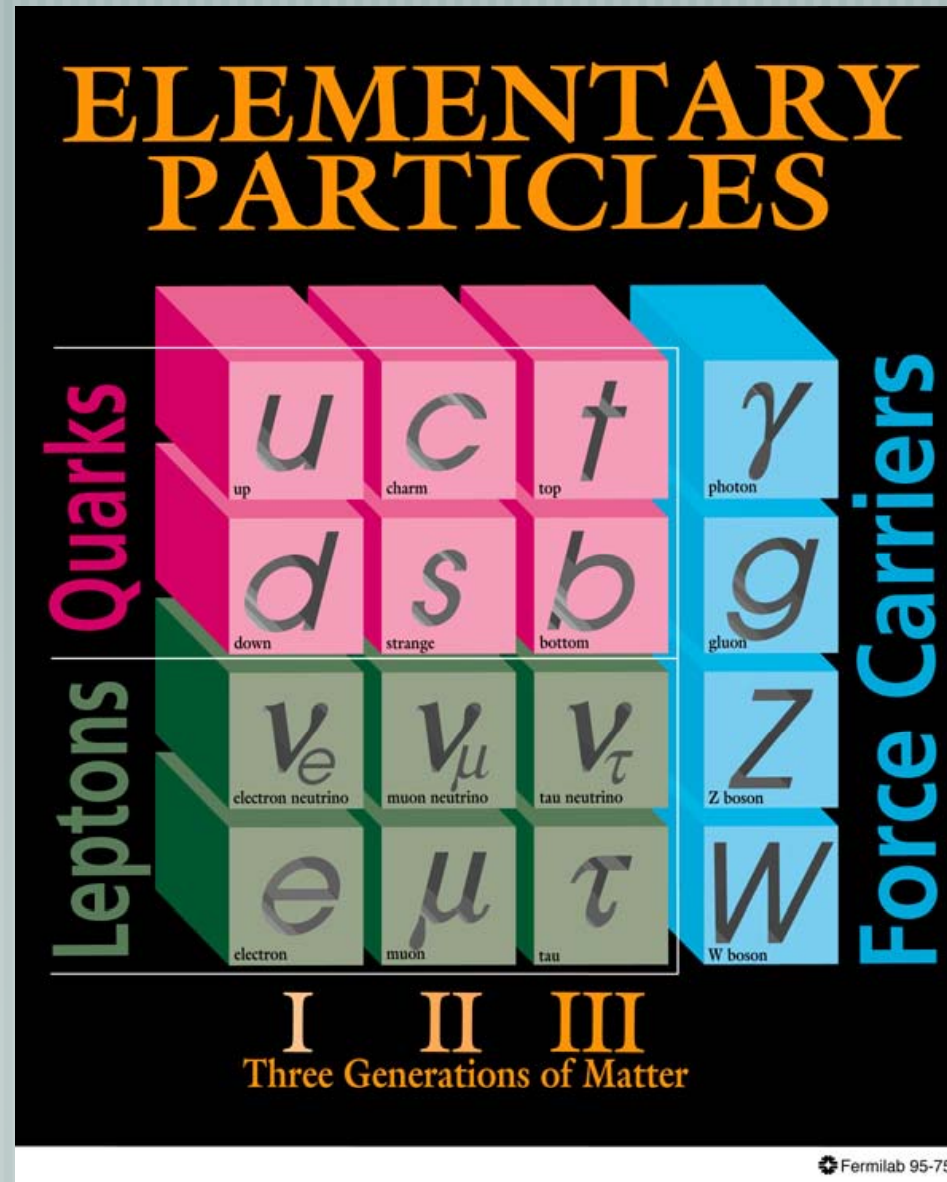

from 'below' - only about 1/2 expected (and seen from 'above')

Neutrinos have mass !

Today, only mass differences are known, but most models assume that the absolute masses are between $\sim 0.01 - 0.1$ eV

Universe (1960)

Age of cosmic objects
less than ~ 12 -13 billion yr
Sun ~ 4.7 billion yr

Universal Ratio H:He $\sim 3:1$
Snapshot at $t \sim 3$ min

Cosmic Microwave Background ?
Predicted (Gamov), ~ 5 K

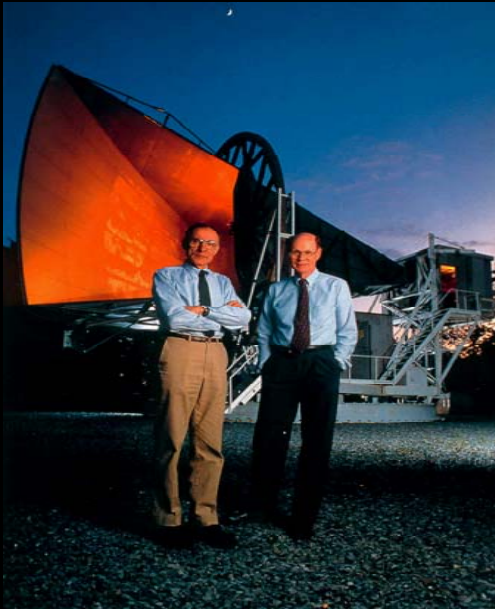

Today: $H = 70 \pm 3 \text{ km s}^{-1} \text{ Mpc}^{-1}$

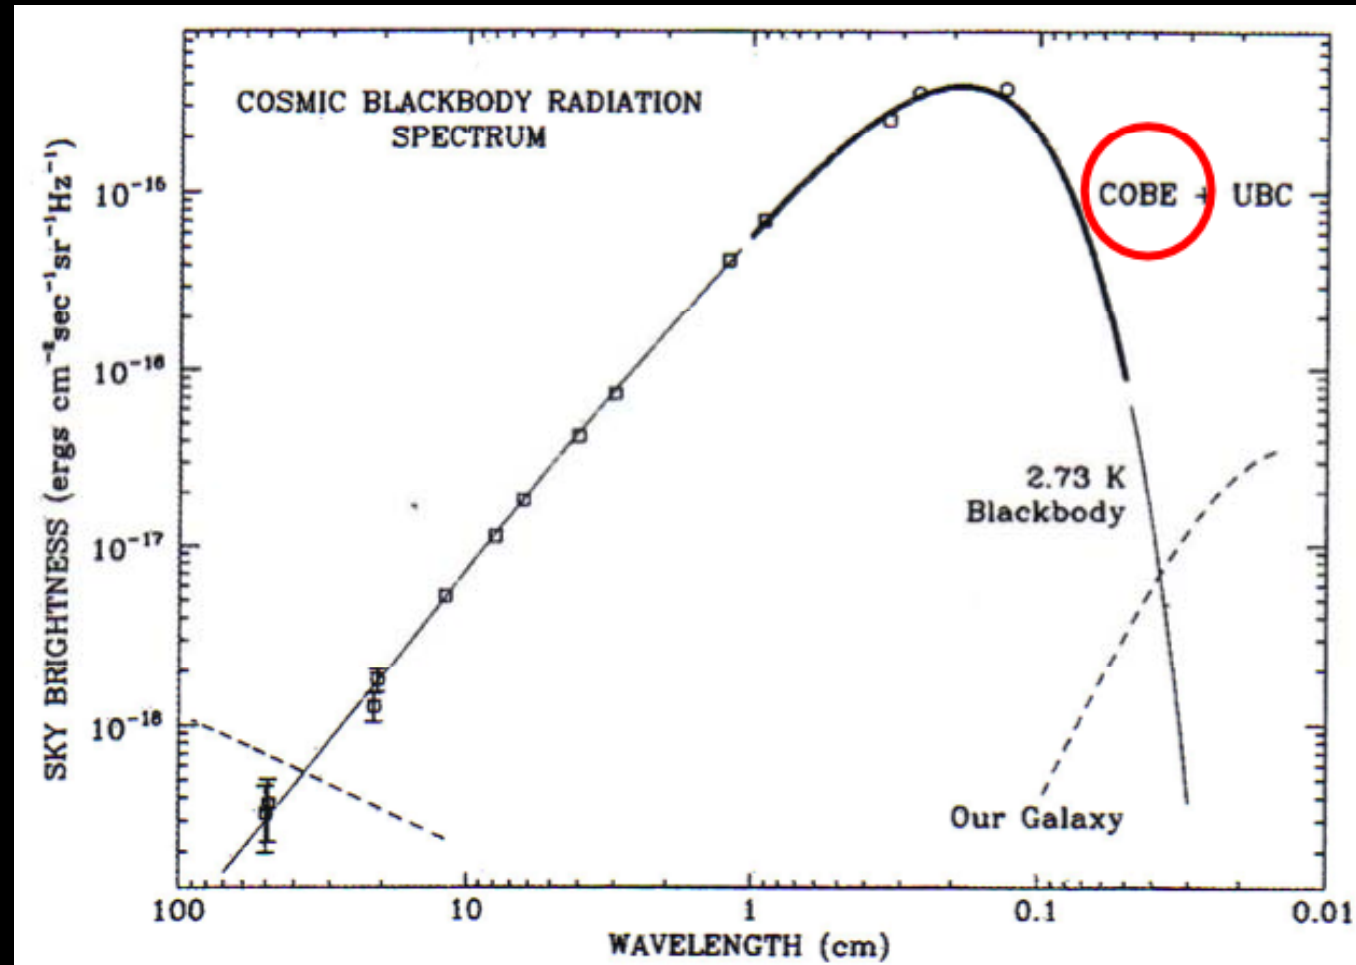

Hubble age (H^{-1}) ~ 13.4 billion years

Universe

The discovery of the 'Cosmic Microwave Background' (1963)

Penzias and Wilson

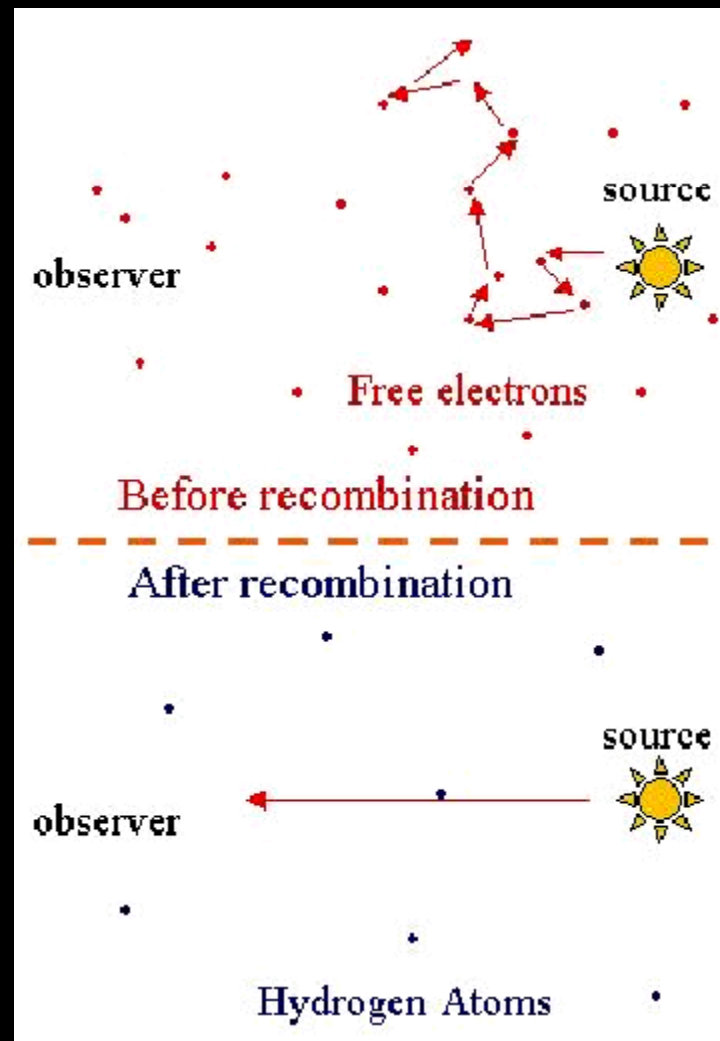

The Universe is a perfect 'black body' with $T = 2.73 \text{ K}$

Universe

How was the cosmic background radiation produced?

By the recombination of free electrons and nuclei

(this was possible when the average energy per photon was smaller than the binding energy)

Universe

The beginning

Size of the visible Universe x 100

At t = 1/1,000 000 000 000 000 000 000 000 000 s

The reconstruction of the History of the Universe

Universe

Big Bang evolution

Time (sec)	Temperature (eV/K)	Phase
10^{-43} s	10^{19} GeV	Grand Unified Theory ?
10^{-35} s	10^{15} GeV	Inflation (GUT breaking) ?
10^{-10} s	10^2 GeV	Electroweak symmetry breaking (W/Z mass)
10^{-5} s	300 MeV	Quarks form hadrons (neutrons, protons, etc)
1-3 min	0.3 MeV	Nucleosynthesis (H, He, Li)
10^5 yrs	0.4 eV = 4000 K	Recombination of nuclei and electrons (transparent!)
10^9 yrs	10 K	Stars, Galaxies; Supernovae produce heavy elements
10^{10} yrs	3 K	Today

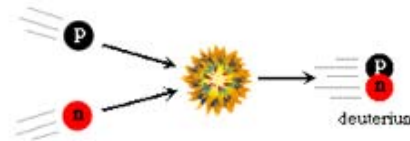

Universe

Big Bang Nucleosynthesis

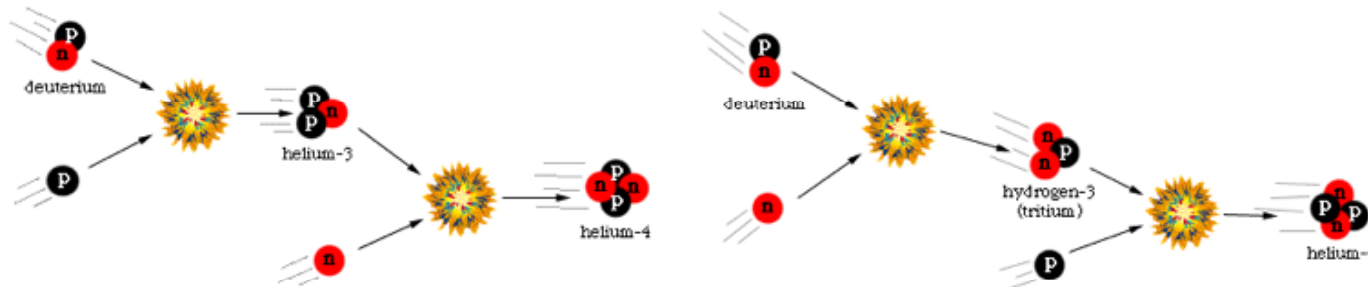

$t=1-3$ mn, $T=0.3-0.1$ MeV

- neutron decay: $n \longrightarrow p + e^- + \bar{\nu} \Rightarrow n/p \sim 1/7$

- Deuterium (all n):

- Helium (all D ie all n + equal number of p):

Helium abundance $\sim \frac{2n}{n+p} \sim 0.25$

H abundance ~ 0.75

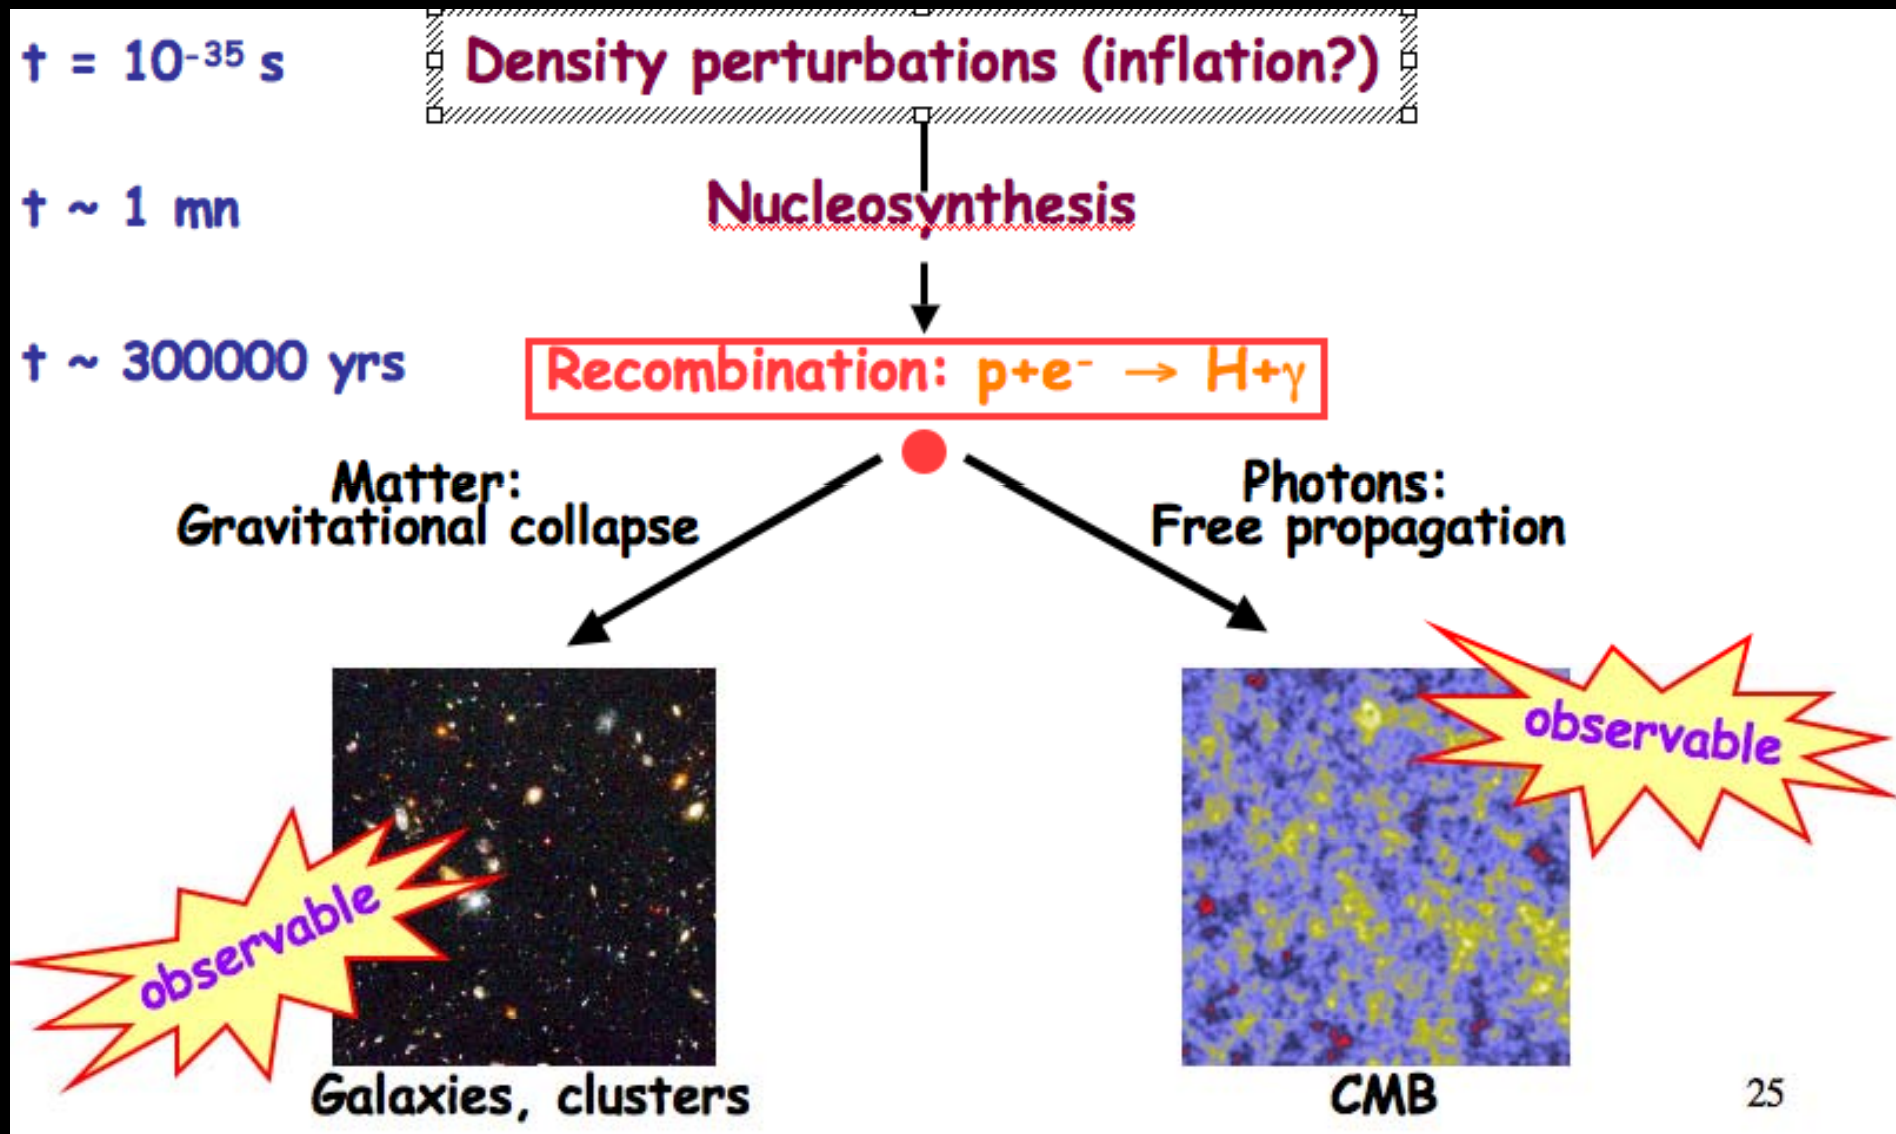

$\eta = n_D/n_H \Rightarrow$ D bottleneck lasts less $\Rightarrow n/p \Rightarrow \text{He}^4$

Universe

What WMAP measured

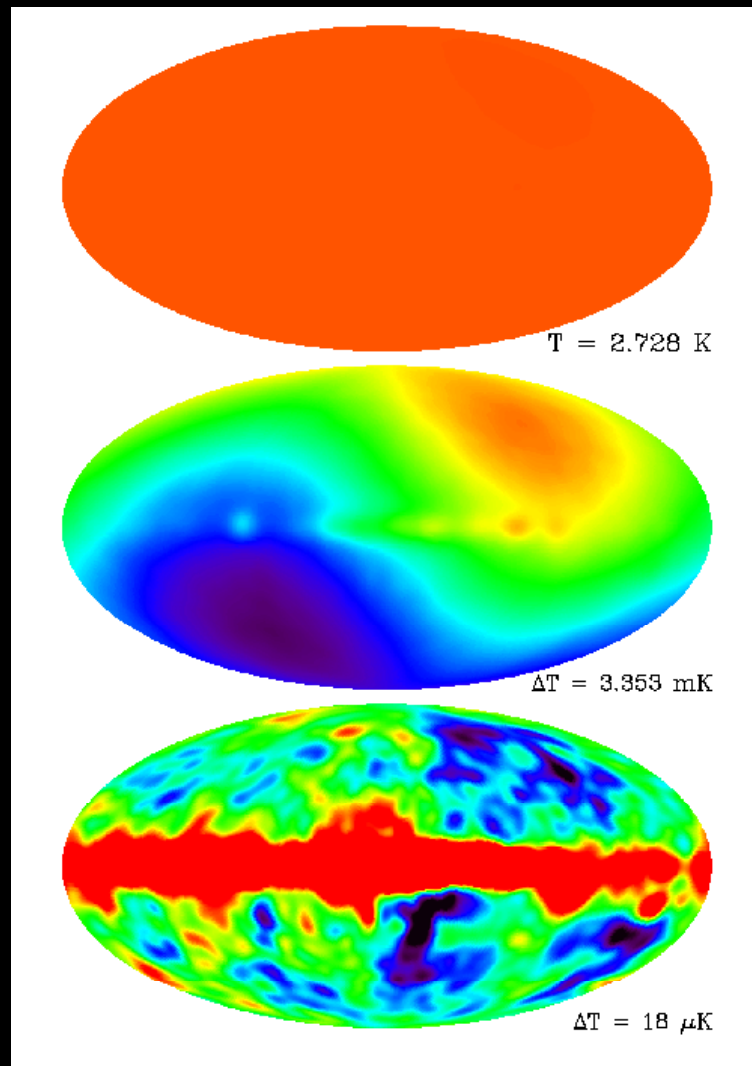

Universe

Back to the Beginning

Universe

Study of the Cosmic Microwave Background (COBE) (Nobel prize 2006)

$$T = 2.7 \text{ K}$$

$$\Delta \epsilon_{\lambda\tau\alpha} - T = 3.3 \text{ mK}$$

(after subtraction of constant emission)

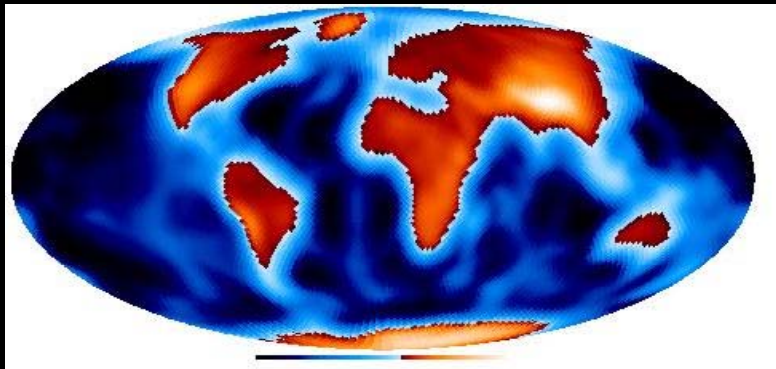

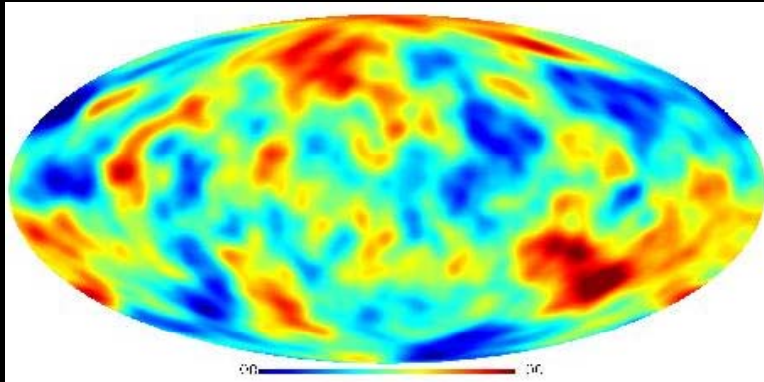

$$\Delta \epsilon_{\lambda\tau\alpha} - T = 18 \text{ } \mu\text{K}$$

(after correcting for motion of Earth)

QUESTIONS FOR THE 21st CENTURY

1) How do particles acquire their mass - the “Higgs” Field ?

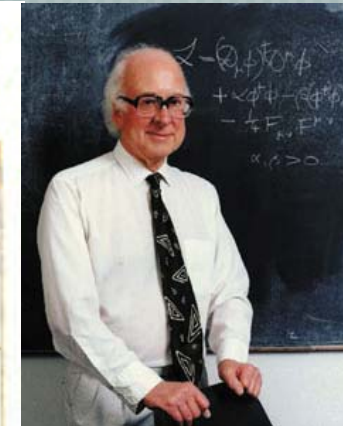

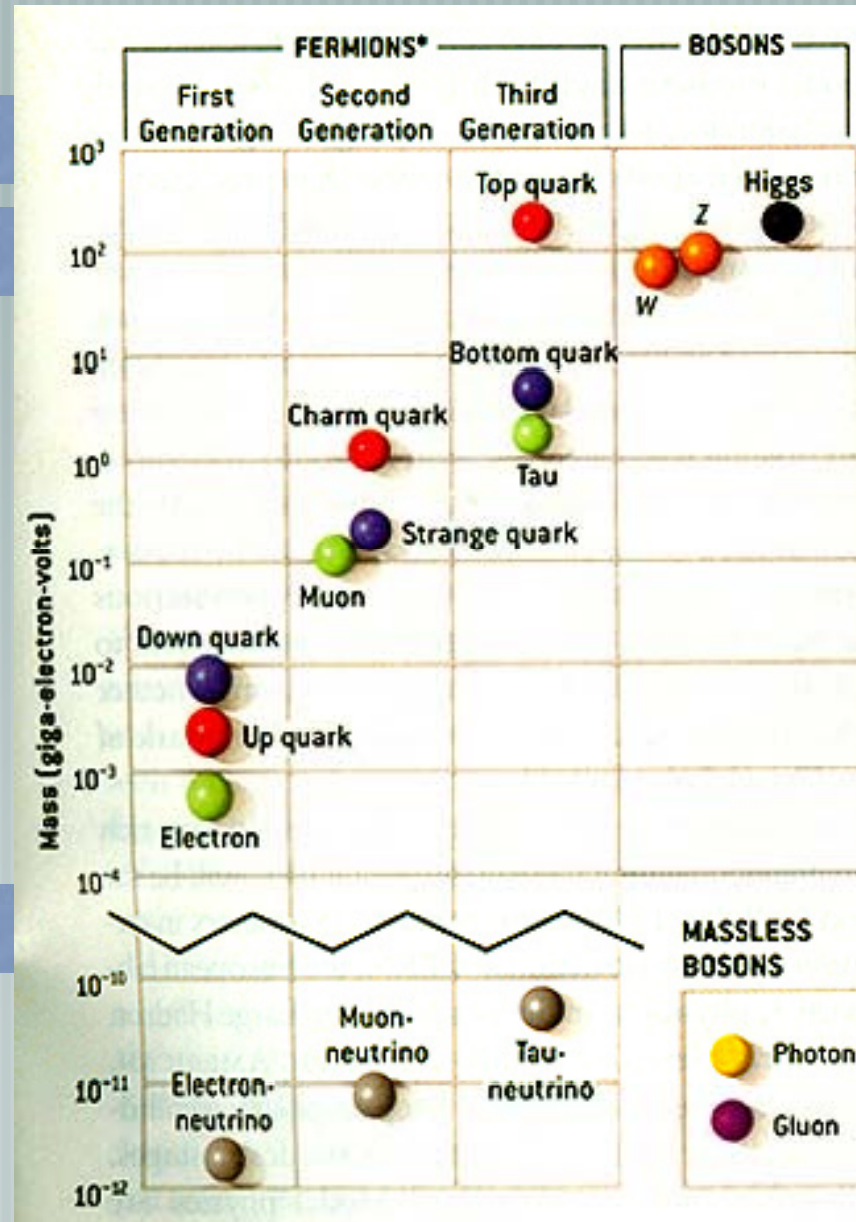

1 TeV →

100 GeV →

1 GeV →

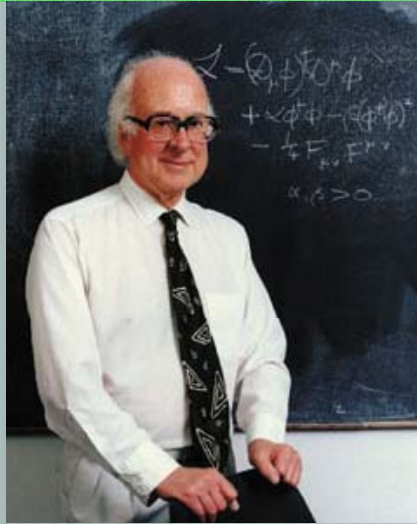

1 MeV →

0.01 eV →

Peter Higgs

QUESTIONS FOR THE 21st CENTURY

Sir Peter Higgs

The Higgs Particle

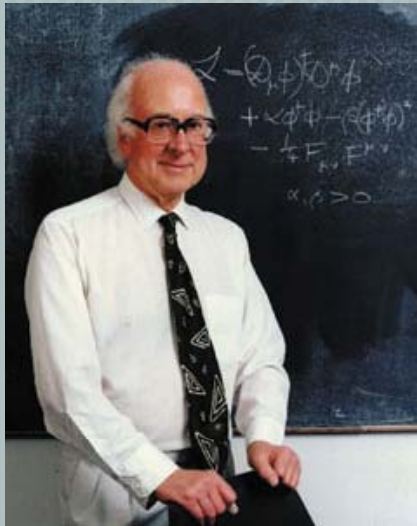

The 'Higgs' field gives mass (inertia) to particles
“friction with the vacuum “

QuickTime™ and a
Microsoft Video 1 decompressor
are needed to see this picture.

How electrons and quarks acquire a mass

QUESTIONS FOR THE 21st CENTURY

The Higgs Particle

Sir Peter Higgs

QuickTime™ and a
Microsoft Video 1 decompressor
are needed to see this picture.

The Higgs 'particle' is an excitation of the Higgs field
- if it exists, it will be found at CERN

QUESTIONS FOR THE 21st CENTURY

2) Are particles and fields connected - Supersymmetry ?

'Matter' particles (Spin 1/2=fermion)) interact by exchanging 'field' (Spin 1=boson) particles:

all particles (electrons, neutrinos, quarks) interact through 'gravitons' and W/Z fields

particles with electric charge (e.g. electrons, quarks) emit photons

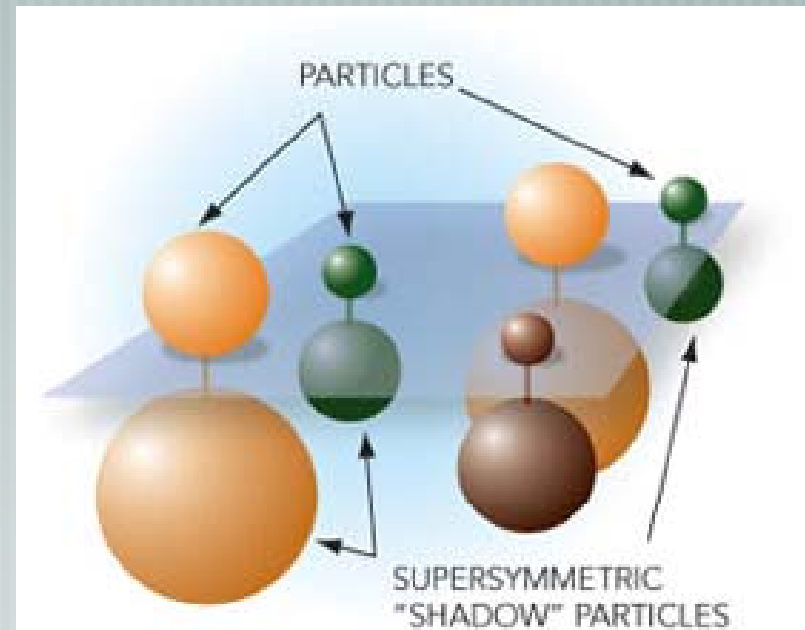

particles with colour charge (quarks) emit gluons

Is there a deeper SUPERSYMMETRY between matter and fields?

all matter particles have a field partner

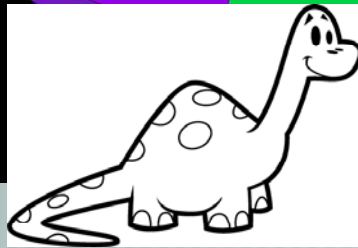

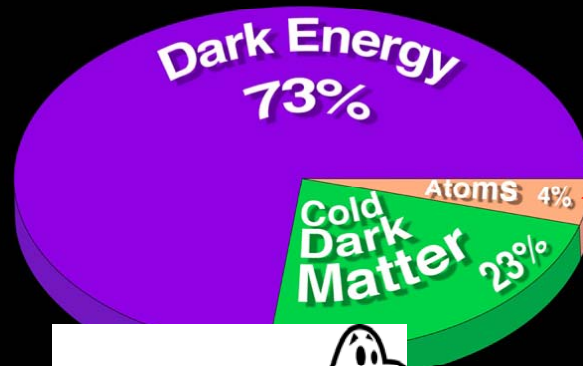

all field particles have a matter partner

Spin 1/2	Spin 1
electron	selectron
quark	squark
photino	photon
gluino	gluon

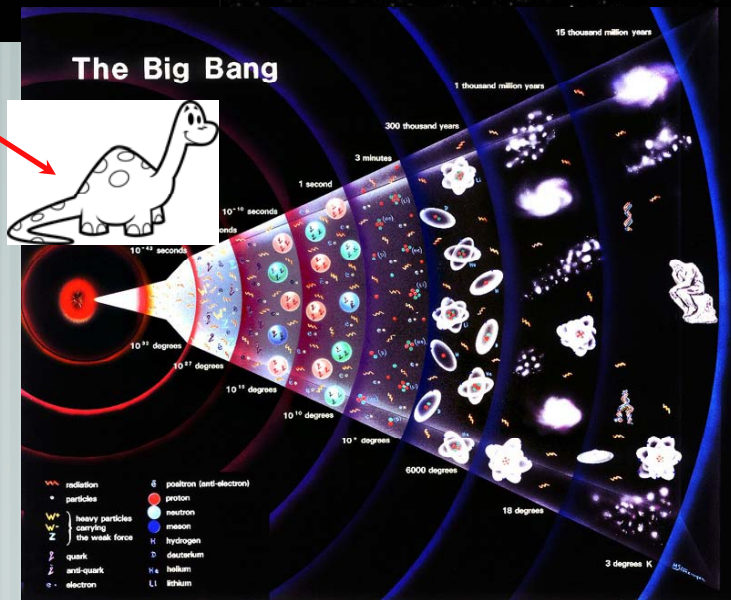

If they exist - they must be VERY MASSIVE (> 200 GeV)

QUESTIONS FOR THE 21st CENTURY

Our type of matter

SUSY = Dark matter particles
left over from Big Bang?

QUESTIONS FOR THE 21st CENTURY

What are particles?

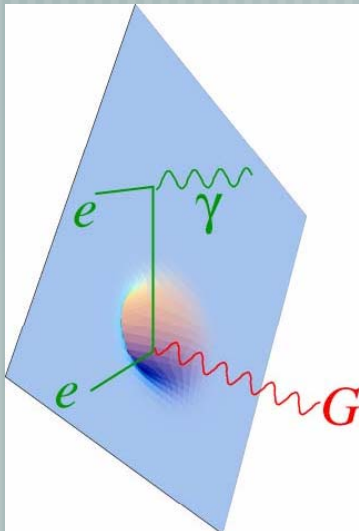

Superstrings in 9+1 dimensions?

Quantum theory of gravity only works in 9-dimensional space
Particles + fields are oscillating 'strings' (size $\sim 10^{-35}$ m)
Different vibration patterns correspond to different particles

String theory 'contains' all known particles (including graviton) and fields
But: no prediction on how the additional dimensions are curled up
No prediction on the scale of the supersymmetry breaking

Signs of Quantum Gravity ?

Does gravity act in **more than 3 spatial dimensions**?

Is gravity so weak because 'gravitons' escape into the small extra-dimensions?
LHC collisions may produce 'mini' Black Holes

Universe

1900 - 2000: Phantastic progress in understanding matter and the Universe

We know what matter is made of.

We know the principle steps in the evolution of the Universe.

Now we have a set of new, deeper questions:

Are quarks and leptons elementary?

Where is the link (remember: charge of proton + charge of electron = 0)

Are there different kinds of matter? (Dark matter?)

Are there new forces of a novel kind?

What do generations mean? How many?

What is the origin and relation of the fundamental constants?

Is life in the Universe an accident? ("Anthropic principle")

Where is the antimatter gone? (Matter-Antimatter asymmetry)

What caused inflation? (Connection cosmological constant?)

How and why did the initial symmetry break? (Unification of forces)

The worst understood part of the Universe: the VACUUM !

This is the physics of the 21st century !

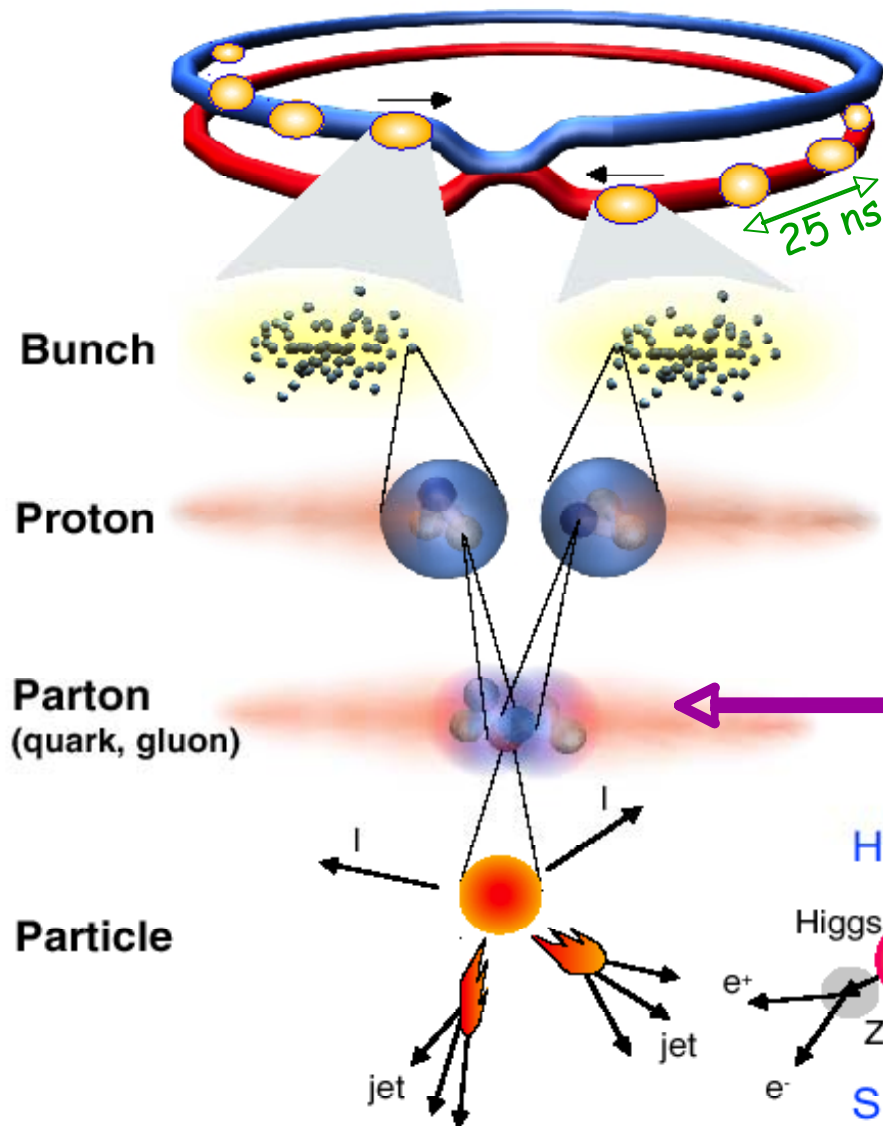

QUESTIONS FOR THE 21st CENTURY

LHC STARTUP IN 2008

new answers !

Collisions at LHC

Proton-Proton

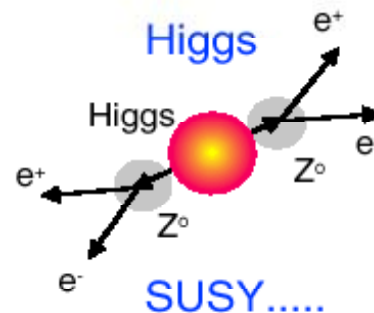

Protons/bunch	10^{11}
Beam energy	7 TeV (7×10^{12} eV)
Luminosity	$10^{34} \text{ cm}^{-2} \text{ s}^{-1}$

Event rate in ATLAS :

$$N = L \times \sigma \text{ (pp)} \approx 10^9 \text{ interactions/s}$$

Mostly soft (low p_T) events

Interesting hard (high- p_T) events are rare
