

Next Generation Scintillation Detectors: Development of Quantum Dot Doped Scintillator

Lindley Winslow
University of California Los Angeles

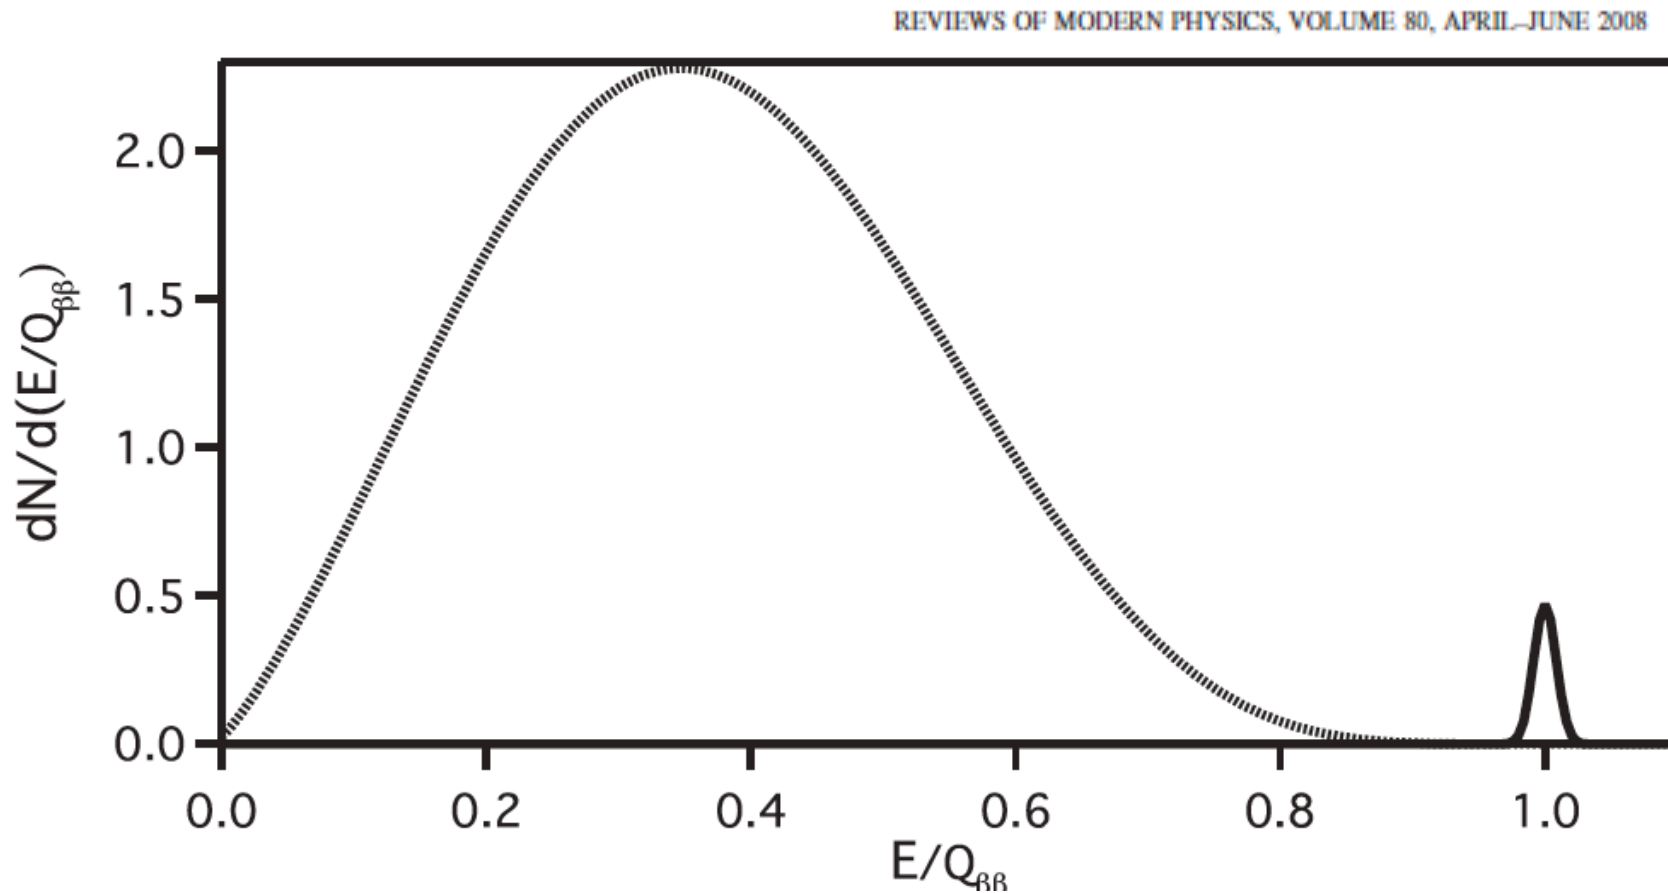

I am particularly interested in applications to ...

Neutrinoless Double Beta Decay

Neutrinoless Double Beta Decay

The sum of the electron energies gives a spike at the endpoint of the “neutrino-full” double beta decay.

An explosion of technology!

...and even KamLAND and SNO are getting in on the action!

An analytical form for comparing experiments:

$$T_{1/2}^{0\nu}(n_{\sigma}) = \frac{4.16 \times 10^{26} \text{ yr}}{n_{\sigma}} \left(\frac{\varepsilon a}{W} \right) \sqrt{\frac{Mt}{b\Delta(E)}}$$

$$T_{1/2}^{0\nu}(n_\sigma) = \frac{4.16 \times 10^{26} \text{ yr}}{n_\sigma} \left(\frac{\epsilon a}{W} \right) \sqrt{\frac{Mt}{b\Delta(E)}}$$

How many sigma you would like to be able to measure.

$$T_{1/2}^{0\nu}(n_{\sigma}) = \frac{4.16 \times 10^{26} \text{ yr}}{n_{\sigma}} \left(\frac{\varepsilon a}{W} \right) \sqrt{\frac{Mt}{b\Delta(E)}}$$

Detector Efficiency

Isotopic abundance

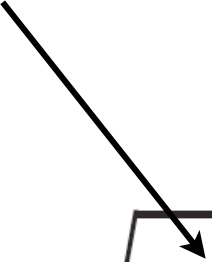

Molecular Weight

Exposure time

$$T_{1/2}^{0\nu}(n_\sigma) = \frac{4.16 \times 10^{26} \text{ yr}}{n_\sigma} \left(\frac{\varepsilon a}{W} \right) \sqrt{\frac{Mt}{b\Delta(E)}}$$

Background rate

Total Mass

$$T_{1/2}^{0\nu}(n_{\sigma}) = \frac{4.16 \times 10^{26} \text{ yr}}{n_{\sigma}} \left(\frac{\varepsilon a}{W} \right) \sqrt{\frac{Mt}{b\Delta(E)}}$$

Being big is what kiloton-scale scintillators are good at!

**Energy resolution is what they
are not so good at....**

$$T_{1/2}^{0\nu}(n_{\sigma}) = \frac{4.16 \times 10^{26} \text{ yr}}{n_{\sigma}} \left(\frac{\epsilon a}{W} \right) \sqrt{\frac{Mt}{b\Delta(E)}}$$

Energy resolution

Wrapped up in the background rate, is some method to convince yourself that you saw neutrinoless double beta decay.

Best way would be to tag the daughter, but tracking the electrons would be nice too!

The angular correlation between outgoing electrons is fairly nucleus independent...

Kotila and Iachello

better with Liquid
Scintillator detectors?***

Basic Principle of Neutrino Detectors

Physics \longrightarrow **Light** \longrightarrow **PMTs**

Typical PMT Detection Efficiency:

Peak Efficiency
300-500nm

Tune Scintillator Emmission:

Nuclear Instruments and Methods in Physics Research A 440 (2000) 360 } 371

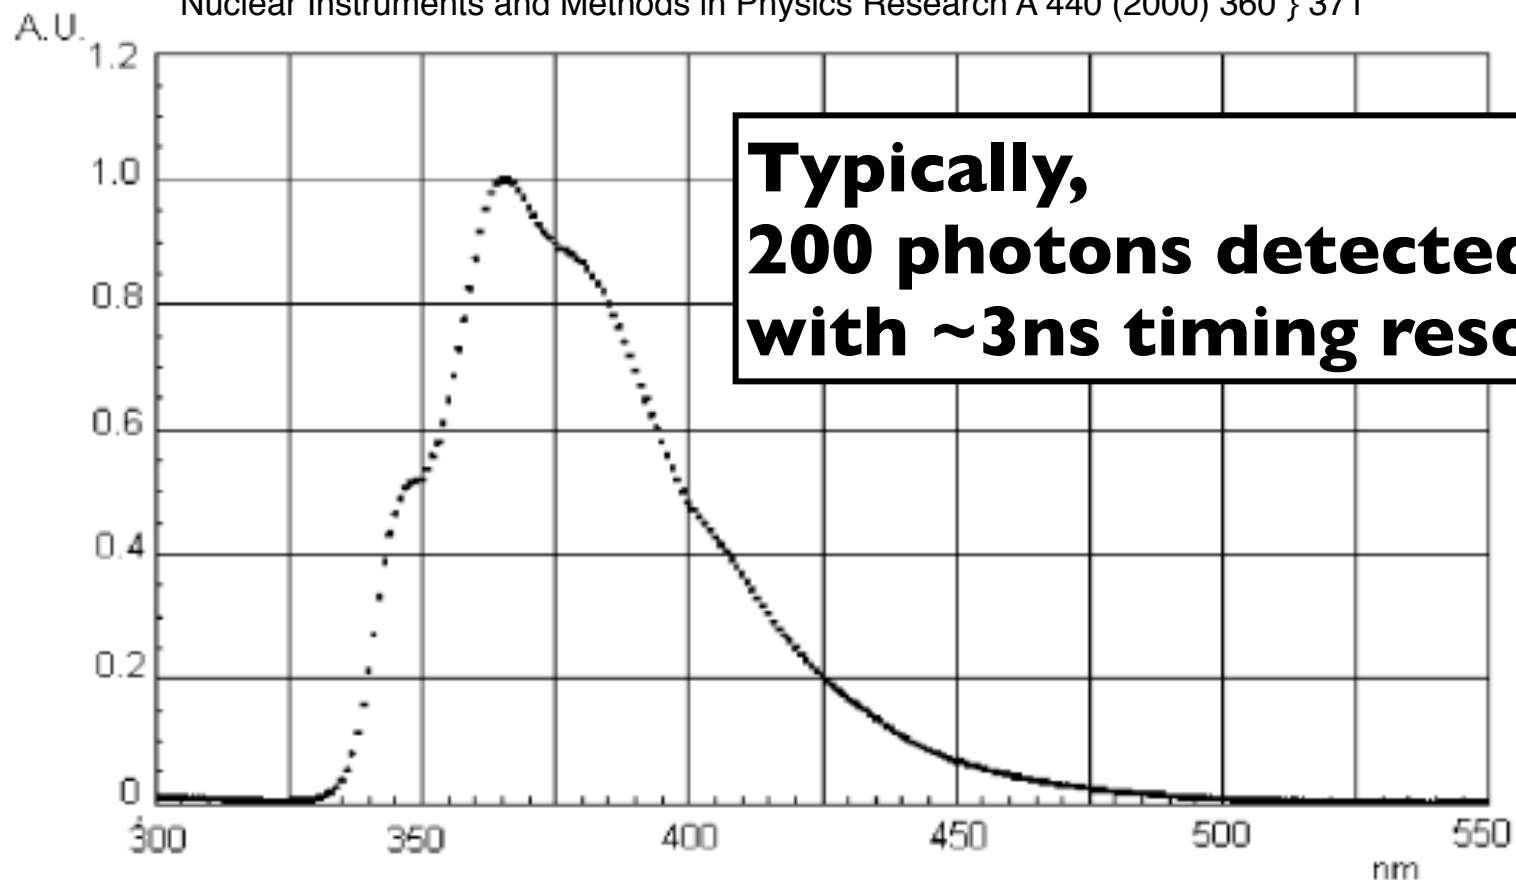

Fig. 1. PC + PPO (1.5 g/l) emission spectrum.

Example is Borexino Scintillator.

Cerenkov Light

MiniBooNE Detector

Scintillation Light

Directionality

Energy Resolution

The Cerenkov light is still there...

Number of Cerenkov Photons for a 1 MeV e-

For KamLAND scintillator, this is 60 (10) photons per MeV above 400nm below 400nm the light is absorbed and reemitted as scintillation light.

What are the handles in a scintillator detector?

Number

Polarization?

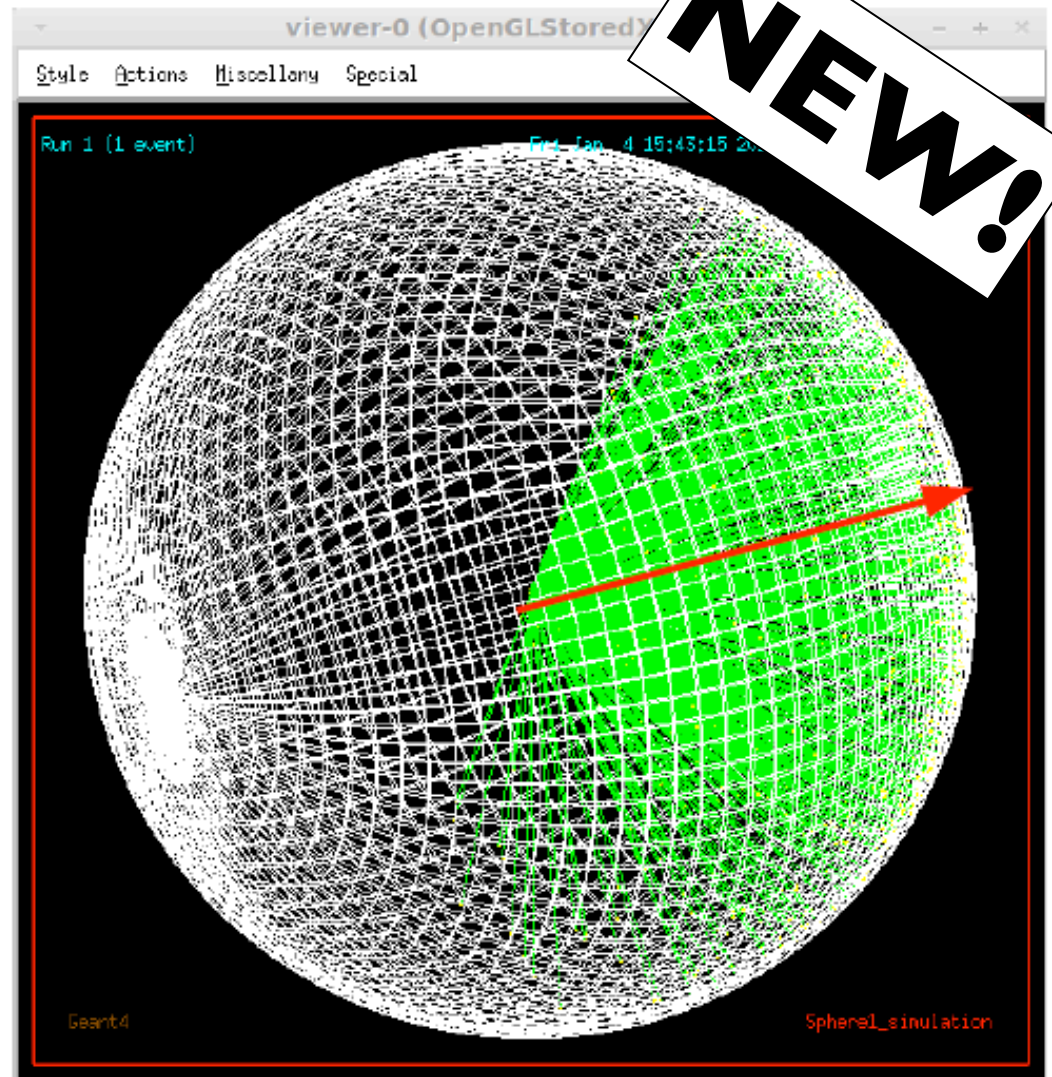

Timing

Wavelength

Geant4 simulation

- Simplified $R=6.5\text{m}$ spherical geometry.
- Simulating single 5MeV electrons.
- Current KamLAND scintillator and PMTs.
- Can we pick out the Cerenkov signal?

Green: optical photon tracks
Red arrow: z-axis

From: Christoph Aberle

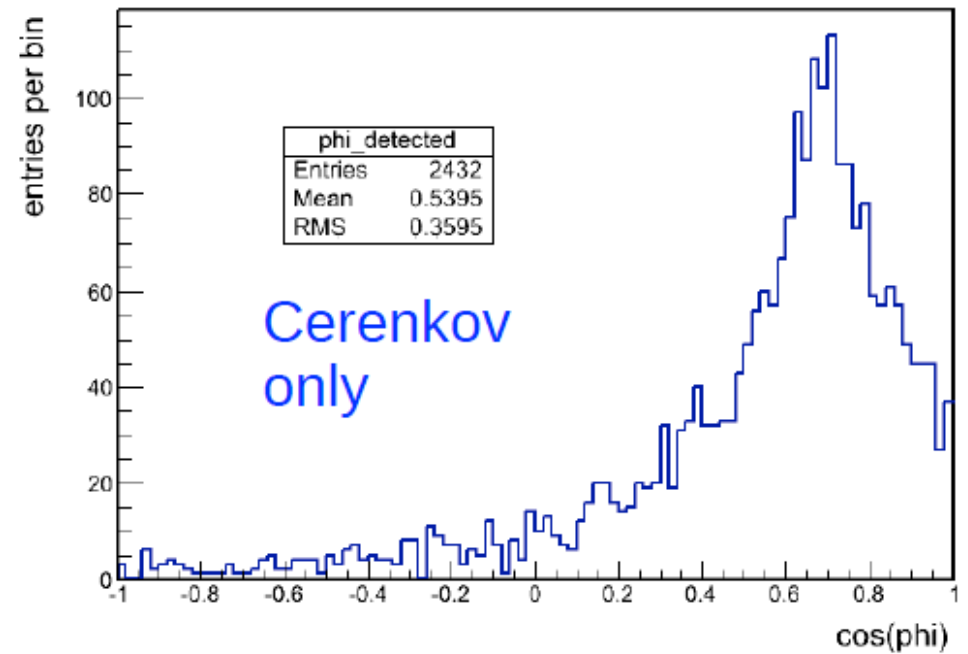

Results for 100 e- events:

Absorption of all photons below 360 nm.

Cerenkov light more important at longer wavelengths.

As expected Cerenkov light is directed forward...

and the Cerenkov light arrives earlier..

Note: 3ns transit time spread of KamLAND PMTs is not great.

Now with a 35ns cut we can pull out a directional signal...

Event by event is going to be difficult, unless...

With perfect timing...

Much better directional distribution...

and even event by event looks possible.

So the timing and photocathode coverage requirements point to something like the LAPPD (higher quantum efficiency would be nice too).

So new photodetectors can be used to tune all 3.

Number

Timing

Wavelength

But can we do anything to the step before?

Physics \longrightarrow **Light** \longrightarrow **PMTs**

Quantum Dot Doped Scintillator

What are quantum dots?

What are Quantum Dots?

Quantum Dots are semiconducting nanocrystals.

A shell of organic molecules is used to suspend them in an organic solvent (toluene) or water.

Common materials are CdS, CdSe, CdTe...

Quantum Dot Materials Overlap with Candidate Isotopes!

| Isotope | Endpoint | Abundance |
|-------------------|-----------|-----------|
| ^{48}Ca | 4.271 MeV | 0.0035% |
| ^{150}Nd | 3.367 MeV | 5.6% |
| ^{96}Zr | 3.350 MeV | 2.8% |
| ^{100}Mo | 3.034 MeV | 9.6% |
| ^{82}Se | 2.995 MeV | 9.2% |
| ^{116}Cd | 2.802 MeV | 7.5% |
| ^{130}Te | 2.533 MeV | 34.5% |
| ^{136}Xe | 2.479 MeV | 8.9% |
| ^{76}Ge | 2.039 MeV | 7.8% |
| ^{128}Te | 0.868 MeV | 31.7% |

Palo Verde

Chooz

The Previous Generation of Short Baseline Reactor Experiments

Aging of the Palo Verde Scintillator:

Making stable metal doped scintillator is tricky.

Chooz's rising threshold:

Instability affect quality of data and duration of data taking.

An older Double Chooz plot:

Quantum dots provide the chemistry for suspending isotope in scintillator.

Why are they so popular?

Because of their small size, their electrical and optical properties are more similar to atoms than bulk semiconductors.

In fact, the optical properties of quantum dots with diameter $< 10\text{nm}$ is completely determined by their size.

Their size is easily regulated during their synthesis.

Example CdS Quantum Dot Spectra:

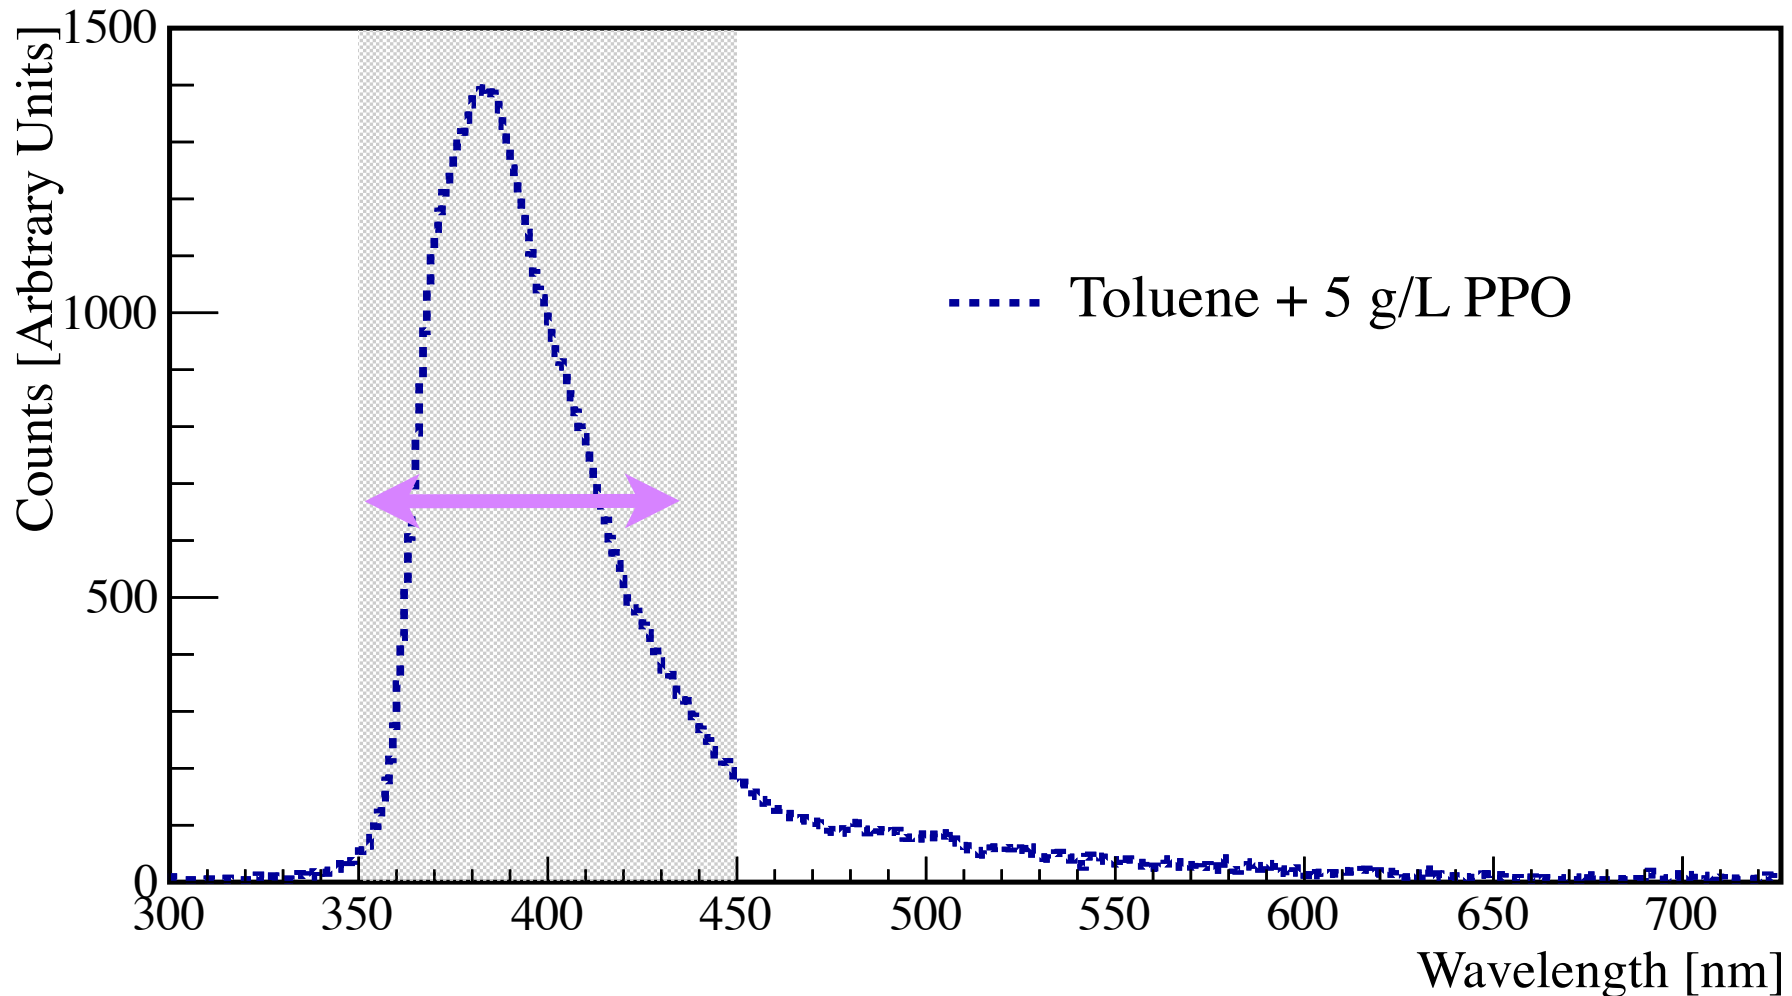

They absorb all light shorter than 400nm and re-emit it in a narrow resonance around this wavelength.

Very Useful for Biology, Solar Cells, and LEDs!

surface states which can be eliminated with a second shell.

My scintillator is toluene with PPO

Adding quantum dots will hopefully tune and narrow the peak of this curve.

Characterizing Quantum-Dot-Doped Liquid Scintillator for Applications to Neutrino Detectors

Lindley Winslow^{a*} and Raspberry Simpson^a

E-mail: lwinslow@mit.edu*

ABSTRACT: Liquid scintillator detectors are widely used in modern neutrino studies. The unique optical properties of semiconducting nanocrystals, known as quantum dots, offer intriguing possibilities for improving standard liquid scintillator, especially when combined with new photodetection technology. Quantum dots also provide a means to dope scintillator with candidate isotopes for neutrinoless double beta decay searches. In this work, the first studies of the scintillation properties of quantum-dot-doped liquid scintillator using both UV light and radioactive sources are presented.

Let's start with some basic measurements!

First spectrometer data with excitation with 280nm LED.

Samples are:

20mL toluene + 5 g/L PPO + 1.25 g/L quantum dots.

How much light?

Excite the scintillator with a 280nm LED.

These dot have a 20% quantum efficiency, state of the art is > 80%.

How much light?

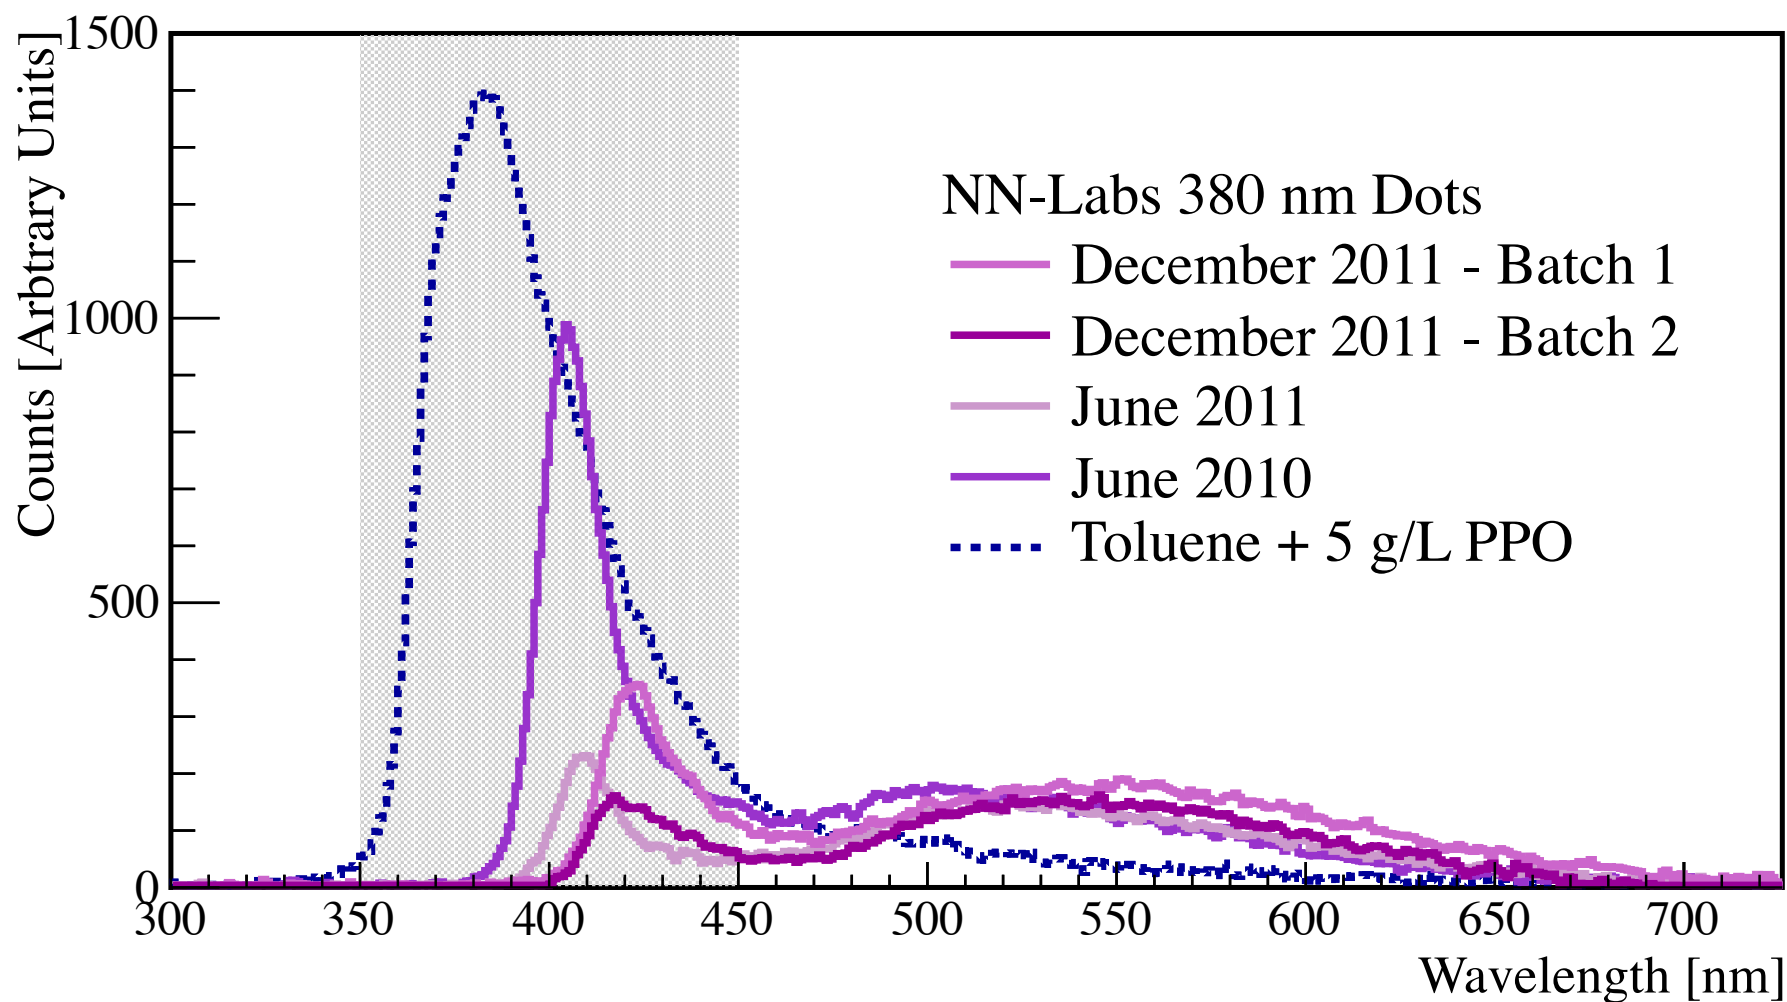

Excite the scintillator with a 280nm LED.

PMT Peak Sensitivity

Do Quantum Dots Age?

One of the NSF reviewers asked if this was an issue.

No evidence for aging.

The bigger issue for us seems to be batch to batch variations.

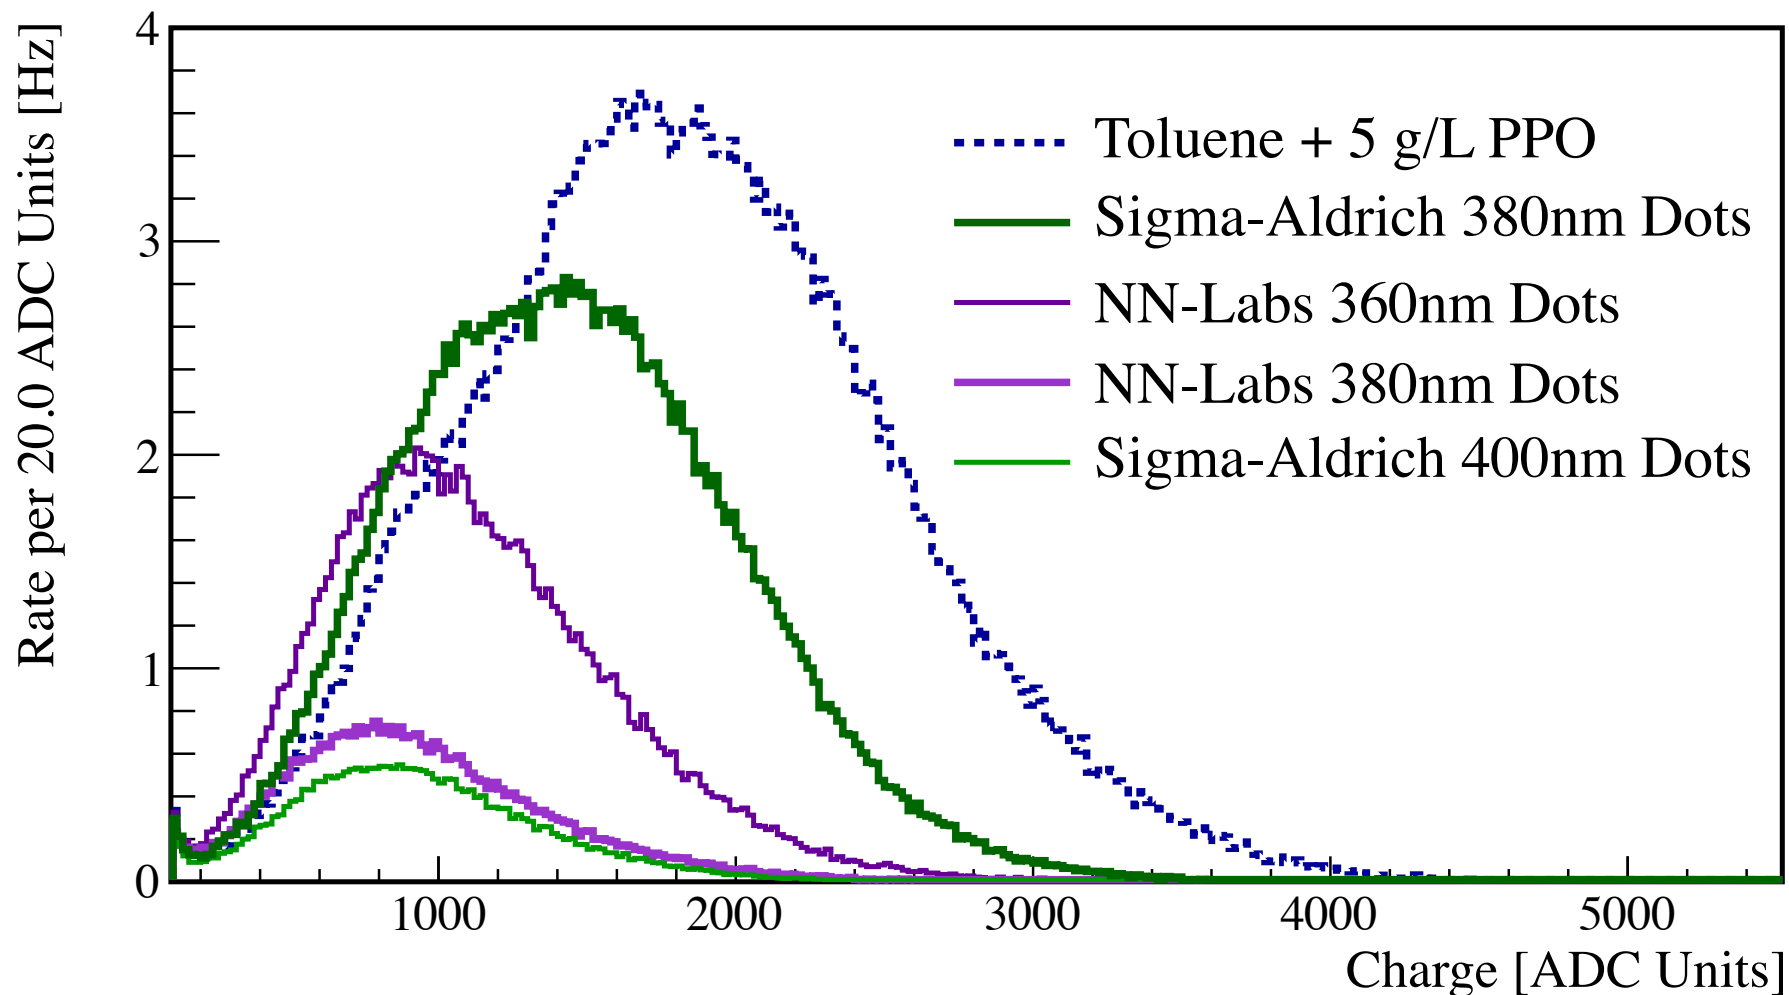

To IGS/s
waveform digitizer.

Simple Two
PMT Setup

Does the scintillator still scintillate?

Study the scintillator with a ^{90}Sr beta source.

The light yield is reduced compared to the standard scintillator

Do quantum dots change the timing characteristics of the scintillator?

The answer is no, though the quantum dot scintillator seems to have a slightly larger late light component.

Fitting to a three exponential model + PMT response:

| Sample | q_1 | τ_1 [ns] | q_2 | τ_2 [ns] | q_3 | τ_3 [ns] |
|-----------|-----------------|-----------------|-----------------|----------------|-------------------|------------------|
| Tol + PPO | 0.94 ± 0.01 | 1.73 ± 0.03 | 0.08 ± 0.01 | 5.7 ± 0.5 | 0.004 ± 0.001 | 45.9 ± 23.4 |
| SA 380 nm | 1.10 ± 0.01 | 1.84 ± 0.02 | 0.09 ± 0.01 | 6.5 ± 0.4 | 0.022 ± 0.001 | 96.5 ± 10.7 |
| NN 360 nm | 0.80 ± 0.01 | 1.55 ± 0.03 | 0.06 ± 0.01 | 10.9 ± 0.7 | 0.092 ± 0.003 | 174.5 ± 14.9 |

***Quantum dots allow you
unprecedented control over the
wavelength response of your
metal-doped scintillator.***

So this is the idea...

Better Scintillator

Better Photo-Detectors

= Better

Next Steps:

↑
Last Spring

$\nu \bullet$

IL Detector - Now

- More quality control of the dots before using.
- Nitrogen purging for better light yield
- Larger quantum quantities
- Attenuation length measurements

The I L detector can be a neutron detector!

Cadmium is a good alternative to Gadolinium.

Next Steps:

ν ●

1 m³ Detector

- Make use of knowledge from IL detector
- Hopefully, experiment with new photodetectors.
- Make measurement of two neutrino double beta decay in ¹¹⁶Cd.

Recall you can have Two Neutrino Double Beta Decay:

With 10g of ^{116}Cd , I expect 1000 events in 6 months.

Next Steps:

ν ●

We are here

***Staged refurbishment
of KamLAND between
2015-2020.***

Next Steps:

ν ●

We are here

Exciting work ahead!

The End
