

Recent Results of the 3D-Stripixel Si Detectors

Monday 2 September 2013 13:30 (20 minutes)

First prototype of the new 3D-Stripixel Detectors has been fabricated by CNM of Spain. TCT test results using lasers of various wavelengths (660 to 1.06um) have shown good 2D-position sensitivity with one-sided processing. CCE test by ALIBAVA using the laser with um-beam size have shown sub-pixel (80 um)2D position resolution. Recent BNL ALIBAVA tests using a 1.06 um laser with mm-beam size have shown clear 2D-position sensitivity as well. The 2D-position sensitivity has been measured as a function of detector bias voltages and laser intensity.

Author: LI, Zheng (BNL)

Co-authors: Dr BASSIGNANA, D. (CNM); Dr LYNN, D. (BNL); Dr PELLEGRINI, G. (CNM); Prof. LIU, Shuhuan (BNL); Ms CHEN, W. (BNL)

Presenter: LI, Zheng (BNL)

Session Classification: Poster

Track Classification: Pixels (including CCD's) - Charged particle tracking
