

Phenomenological applications of non-perturbative heavy quark effective theory

Wednesday 23 January 2008 11:50 (20 minutes)

We briefly review the strategy to perform non-perturbative heavy quark effective theory computations and we specialize to the case of the b quark mass which has been recently computed including the $1/m$ term. We consider another phenomenologically relevant quantity where this strategy could be applied, the B_B parameter which is related to the neutral B meson mass difference.

Presenter: PAPINUTTO, Mauro (CERN)
