Forward jet production and BFKL effects at the LHC

Monday, 2 December 2013 15:45 (20 minutes)

Phenomenological aspects of search for BFKL effects at LHC energies are briefly reviewed. Different observables for forward dijets with large rapidity separation are discussed. In particular, azimuthal angle decorrelations of Mueller-Navelet dijets and ratios for inclusive dijet and Mueller-Navelet dijet cross sections to two-jet cross section are considered.
