~30 instruments

~~~ *The Menu* ~~~

- What is **Monte-Carlo** ? (not only a casino)
- Instrument simulation **codes**
- Instrument **components**
- Examples of **neutron instruments**
- **Virtual experiments**
- Demo: **a diffractometer, TAS, a UCN moderator**

Origin of Monte Carlo methods

Used by Nature since ... (a long time) : diversity of Life

First application using computers:

Metropolis, Ulam and Von Neumann at Los Alamos, 1943

Neutron Scattering and Absorption in *U* and *Pu*, Origin of *MCNP*

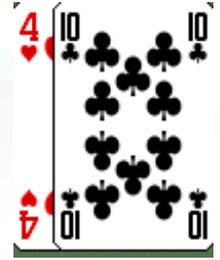

Name:

Monte Carlo casino, a random generator (Ulam played poker)

What are Monte Carlo methods ?

- Use random generators (play poker)
- Explore a complex and large phase space (many parameters)
- Integrates microscopic random events into measurable quantities
not a usual regular sampling integration

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1, a < u_i < b}^n f(u_i) = \frac{1}{b-a} \int_a^b f(u) du$$

- *Metropolis* algorithm: model energy gap E as a probability

$$p \propto e^{-E/kT}$$

- Integrals converge faster than *any* other method (for $d > 3$)
when using *enough* independent events (central limit theorem)

F. James, *Rep. Prog. Phys.*, Vol. **43** (1980) 1145.

How to implement Monte Carlo methods ?

Good random generator:

- from thermal electronic noise (hardware)
- or quasi-random generators => *quasi-Monte-Carlo*

We encounter a probability $0 < p < 1$.

Crude Monte-Carlo (yes/no choice):

We shoot n events $\xi \in [0,1]$

We keep events that satisfy $\xi < p$

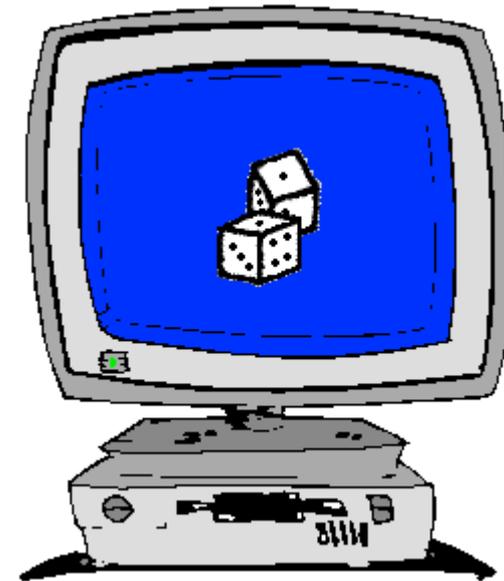

np events \rightarrow low statistics

Importance sampling (fuzzy choice – event weighting):

Keep n events, no more random number...

But associate a **weight** p to each of them (we set $\xi = p$)

Retain statistical accuracy ($1/\sqrt{n}$)

When to use Monte Carlo methods

Dimensionality of phase space must be large ($d > 5$)

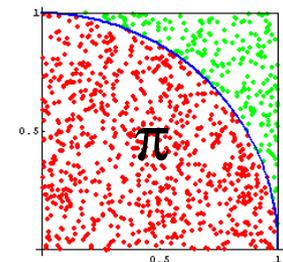

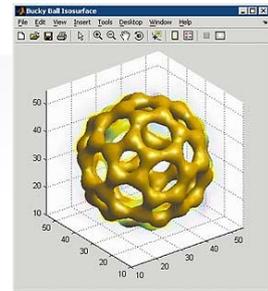

Overall complexity is beyond reasonable analytical methods

Each event can be computed easily and independently

MC is the '*lazy guy*' method – think microscopic

Examples:

- Estimate π from a circle/square (“*Buffon needle*”)
- Area under/inside a curve/volume (integration)
- Molecular Dynamics
- spin-system phase transitions (*Ising* model)
- nuclear reactions
- ray-tracing (light, particles)

Number of points for which
 $\{ x^2+y^2 \leq 1, (x,y) \in [0,1] \}$
 Ratio circle/square $\rightarrow \pi/4$

Some Monte Carlo programs

Each time physics takes place (scattering, absorption, ...) random choices are made.

Light ray-tracing: PoV-RAY and others ...

Nuclear reactor simulations (neutron transport):

MCNP, Tripoli, GEANT4, FLUKA

Neutron Ray-Tracing propagation:

McStas <www.mcstas.org>, Vitess, Restrax, NISP, IDEAS

Neutrons are described as $(\mathbf{r}, \mathbf{v}, \mathbf{s}, \mathbf{t})$, and are transported along models.

Propagation simply uses Newton rules, incl. gravitation.

X-ray tracing

Shadow, McXtrace

McStas: an EU neutron scattering Monte-Carlo code

Flexible, general simulation utility for neutron scattering experiments.

Original design for Monte Carlo Simulation of triple axis spectrometers.

Developed at RISØ and ILL (started 1998).

Mainly funded by EU (FP 4-7): 2.5+1 people full time, plus projects.

Open source, GPL2.

Works on all systems, source and binaries for *Linux*, *Win\$*, *MacOSX*, *Live-DVD*

Most widely used code in its ecological niche (compared to other similar codes)..

A few hundred users worldwide
some contributors (community based).

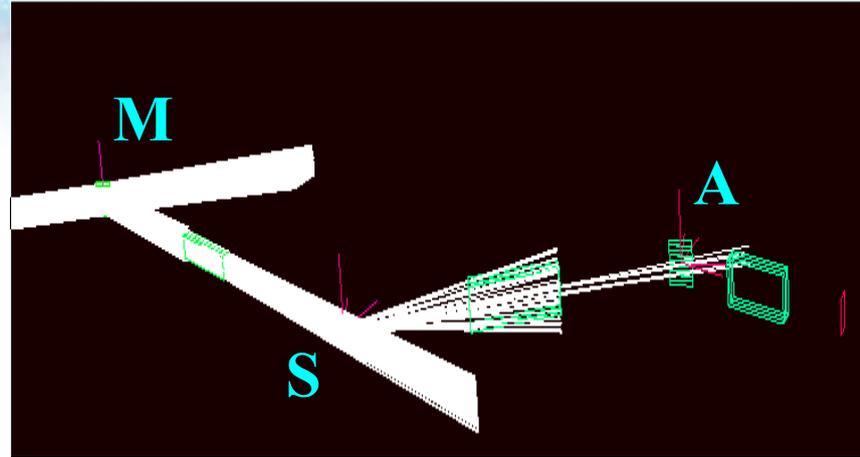

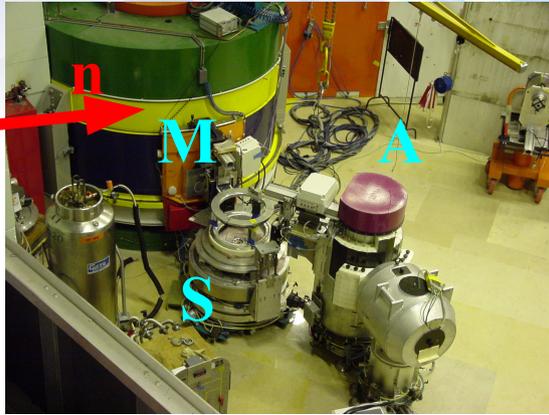

*Has been used to model most existing and future
neutron scattering instruments.*

Simulating instrument: what for ?

A Triple-Axis Spectrometer (IN20)

- **Design** new instruments
- **Optimize existing** instruments (flux/resolution)
- **Optimize usage** of existing instruments (better experiments)
- **Get accustomed** with the instruments before coming at the ILL
- Measure the **instrument effects** on the simulated 'ideal' sample signal
- Estimate complex effects like :
 - absorption, multiple scattering, geometry, resolution function...
- **Compare** virtual experiments with real ones, possibly during exp.

Schematic neutron propagation **n**

Schematic neutron propagation n

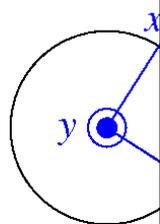

Neutron ray/package:

Weight (p): # neutrons (left) in the package

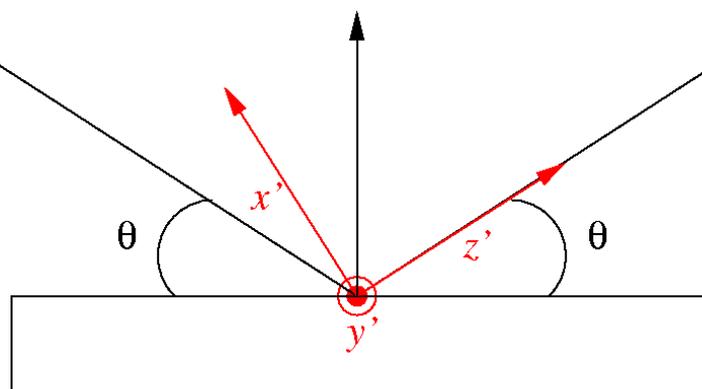

Coordinates (x, y, z)

Velocity (v_x, v_y, v_z)

Spin (s_x, s_y, s_z), Time (t)

ector

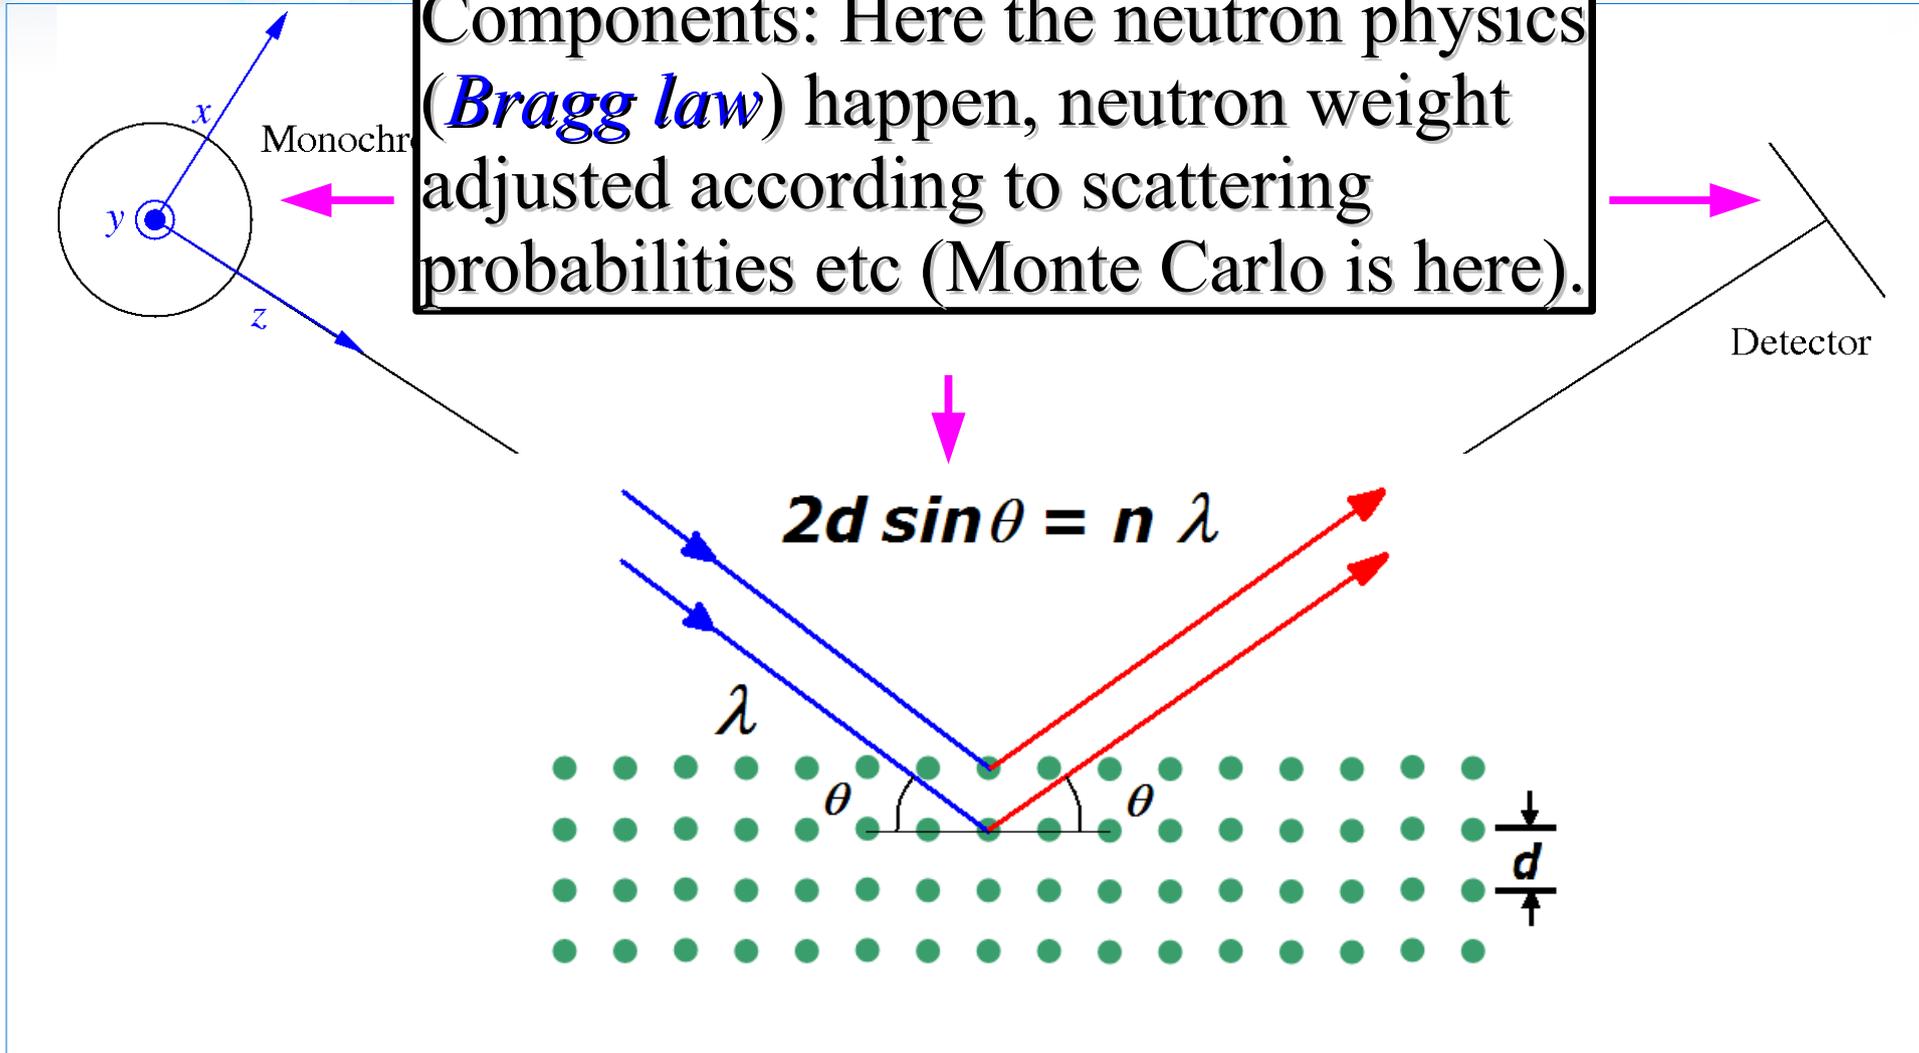

Crystal in Bragg scattering condition

Schematic neutron propagation

n

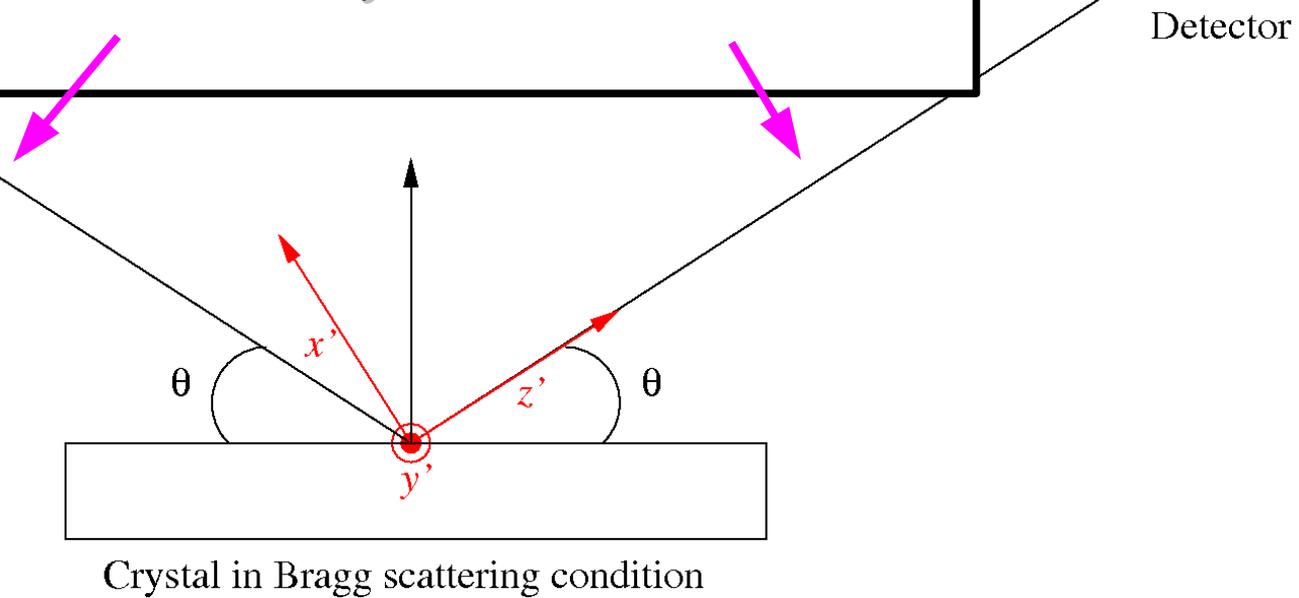

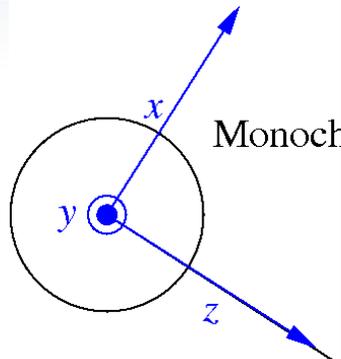

Components: Here the neutron physics (*Bragg law*) happen, neutron weight adjusted according to scattering probabilities etc (Monte Carlo is here).

Schematic neutron propagation

n

Instrument: positioning + transformation between sequential component coordinate systems, e.g. neutron source, crystal, detector.

Detector

Crystal in Bragg scattering condition

McStas grammar

Instruments are defined from a text file. General syntax is based upon C.
Basic syntax:

```
DEFINE INSTRUMENT name(parameter1=value1, ...)
```

```
DECLARE % { /* global variables */  
% }
```

```
INITIALIZE % { /* code executed when starting */  
% }
```

```
TRACE /* sequence executed for each neutron event */
```

```
COMPONENT InstanceName=component(parameters...)
```

```
AT (position) RELATIVE reference
```

```
ROTATED (orientation) RELATIVE reference
```

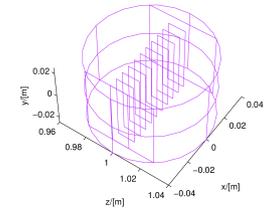

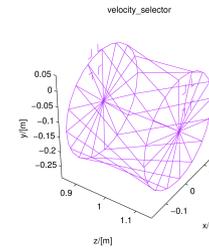

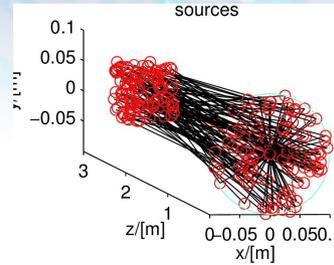

```
...
```

```
END
```

McStas components

Sources (neutrons)

Continuous (reactor), Pulsed

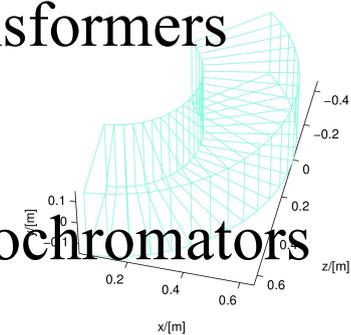

Moving optics

Choppers (disk and Fermi), velocity selectors, phase space transformers

Static optics

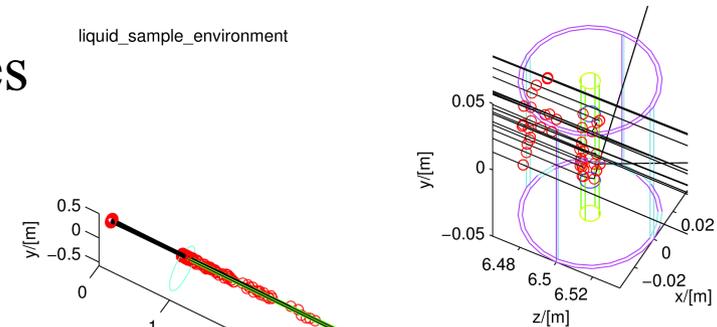

Guides, mirrors, benders, lenses, collimators, slits, filters, monochromators

Samples/materials

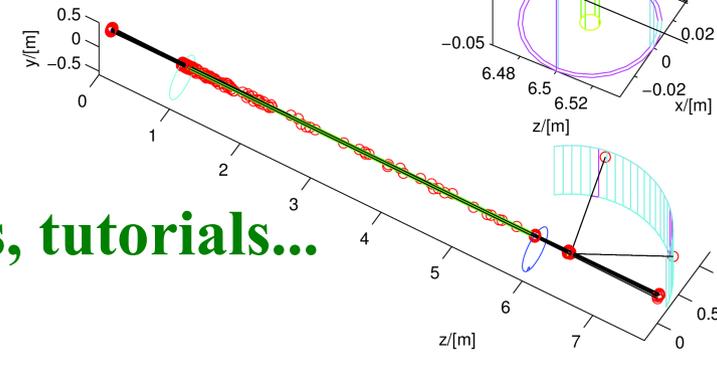

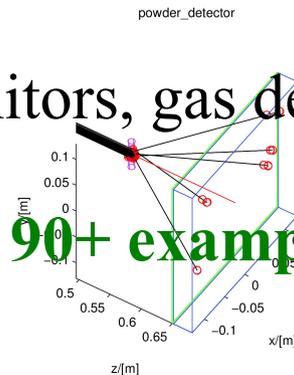

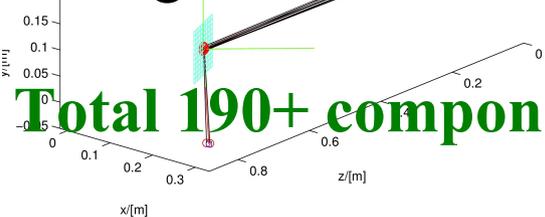

Single crystals, liquids, gas, polymers, hard spheres

liquid_sample_environment

Detectors

Histogram and event monitors, gas detectors

Total 190+ components, 90+ examples, manuals, tutorials...

Virtual experiments: definition

Neutron *flight simulator*

and then we play with it without breaking the instrument and sample.

- E. Farhi *et al*, *J. of Comp. Phys.* **228** (2009) 5251
- E. Farhi and P. Willendrup, *Collection SFN* **12** (2011) 303
- E. Farhi *et al.*, *J. Neut. Res.*, **18** (2013)

McStas: available sample components

Most instrument components are 'easy' to implement.
The samples are often more complex.

Scattering	Input	Coherent		Incoherent		Multiple
		Elastic	Inelastic	Elastic	Inelastic	
PowderN	$ F^2(q) , abc, \sigma$	Powder		X		
Single_crystal	$ F^2(hkl) , abc, \sigma$	Crystal		X		X
Isotropic_Sqw	$S(q,w), \sigma$	Isotropic	X	X	X	X
Incoherent	σ			X	QuasiE	
Sans_sphere	ρ, σ, R	colloid				
Sample_nxs	CIF data	Powder		X		X

Sample geometry: box, cylinder, sphere, PLY/OFF file

Isotropic_Sqw: liquids, gas, glass, polymers, powders, ...

Neutronist's Mantra

$$\frac{d^2\sigma}{d\Omega dE_f} = \frac{\sigma}{4\pi} \frac{k_f}{k_i} NS(q, \omega)$$

Holy Book (Squires)

Effective cross section for scattered intensity

$$\hat{\sigma} = \iint \frac{d^2\sigma}{d\Omega dE_f} d\Omega dE_f$$

V.F. Sears. *Adv. Phys.*, **24** (1975) 1

We like to play games in (q, ω) space

$$\frac{d\Omega}{d\theta} = -2\pi \sin\theta$$

$$\frac{dq}{d\theta} = -\frac{k_i k_f \sin\theta}{q}$$

Effective cross section in (q, ω) space

$$\hat{\sigma} = \sigma \iint \frac{S(q, \omega) q}{2k_i^2} dq d\omega$$

$$\sigma_{\text{cone}} = \frac{V}{V_0^2} \frac{\lambda^3}{4 \sin\theta} \sum_Q |F(Q)|^2$$

Powder:

Probability to interact

$$p = e^{-\rho \hat{\sigma} x}$$

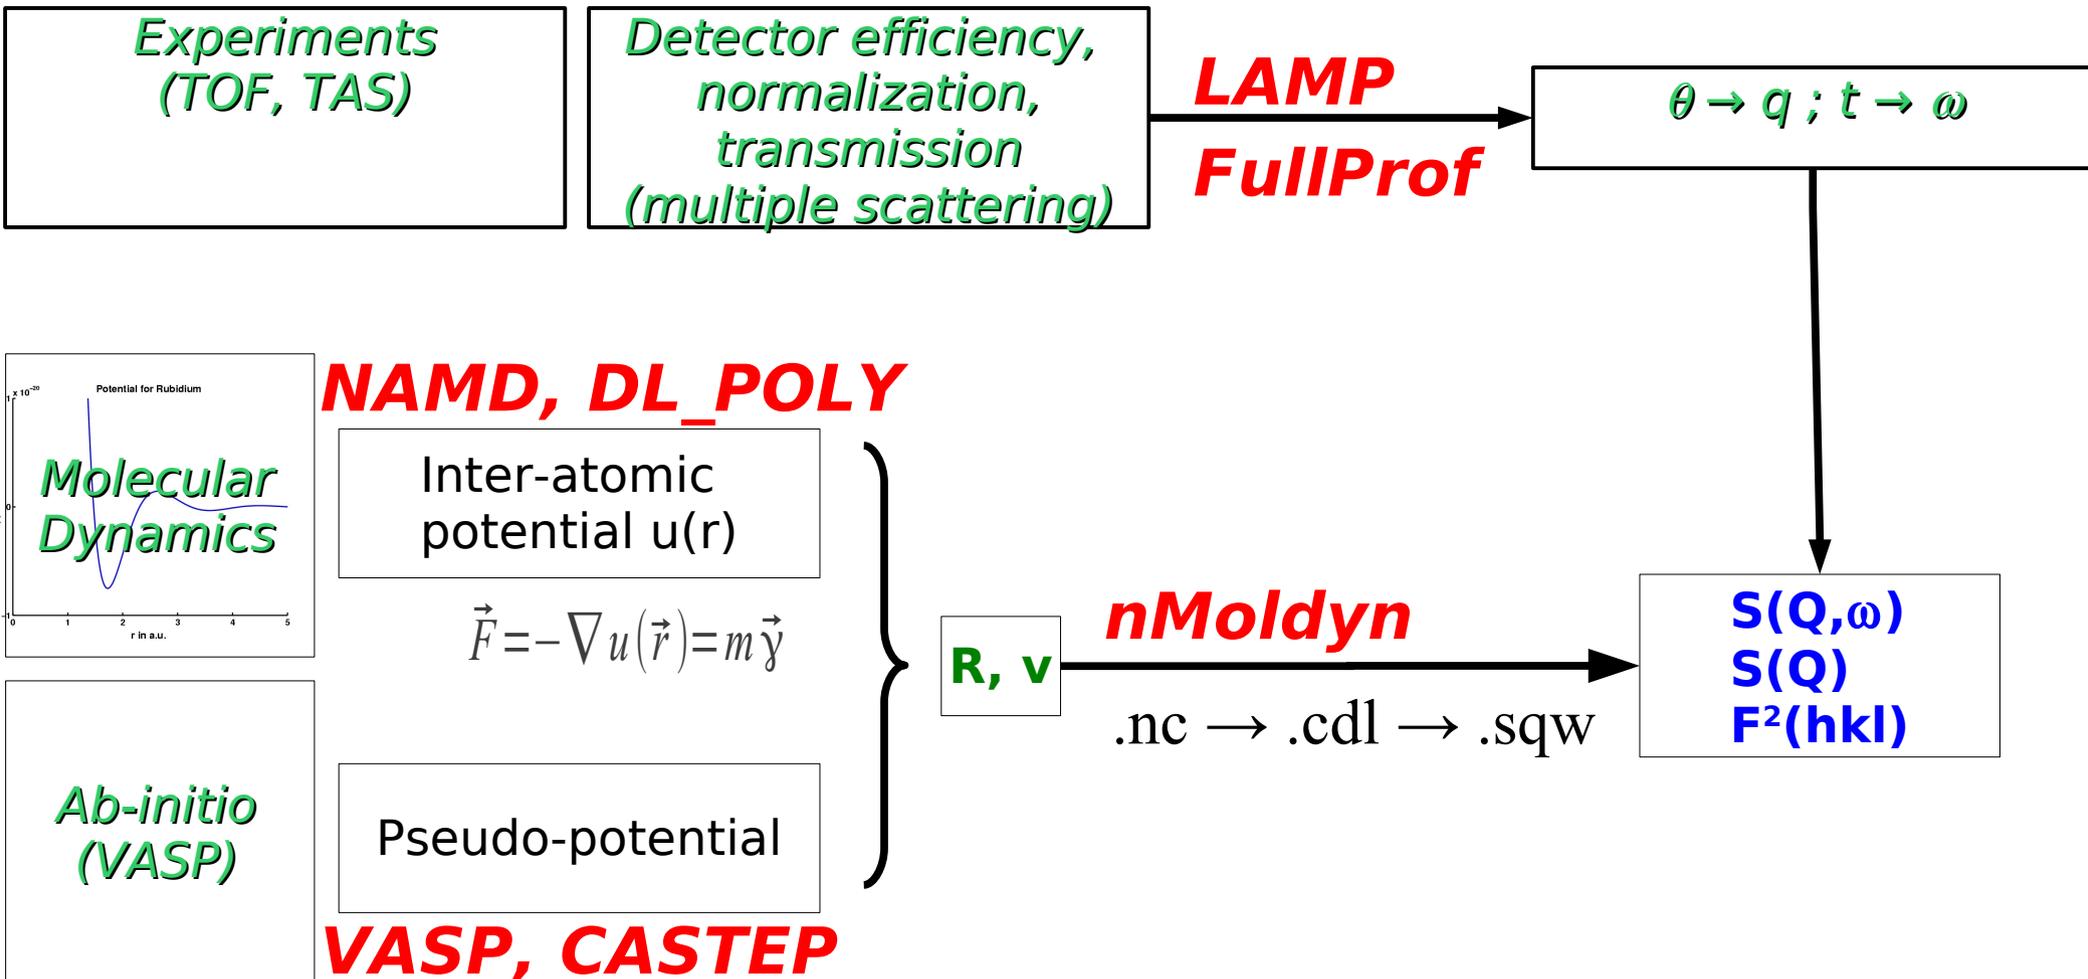

Scattering distribution

$$S(q, \omega)$$

with importance sampling to scatter preferably where S is large

Obtaining material characteristics

The dynamic structure factor $S(q, \omega)$ can be obtained from experiments, assuming a proper data reduction, or from MD.

Benefits from a virtual experiment

Benefits:

- The resolution from the instrument is implicitly convolved with the sample, without analytical integration
- The 'spurious' effects from the instrument can be included
- Treat absorption in the sample (self attenuation= 2^{nd} extinction)
- Treat coherent/incoherent scattering
- May include multiple scattering (depends on the sample component)
- May model the measurement background

Requirements:

- Need as accurate instrument description as possible
- Use proper sample component/kernel
- Give accurate data to the sample component (experiment, MD, ...)
- Be critical regarding the results (*it's so easy to get rubbish*)

Time for examples

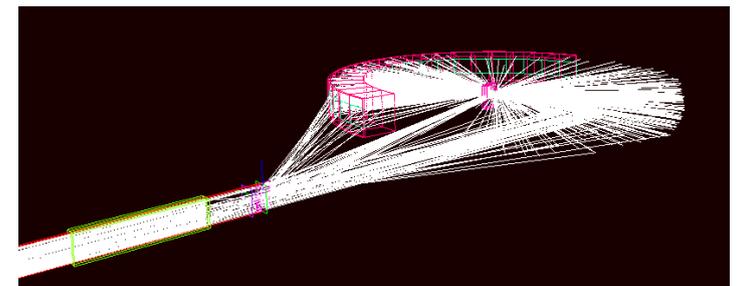

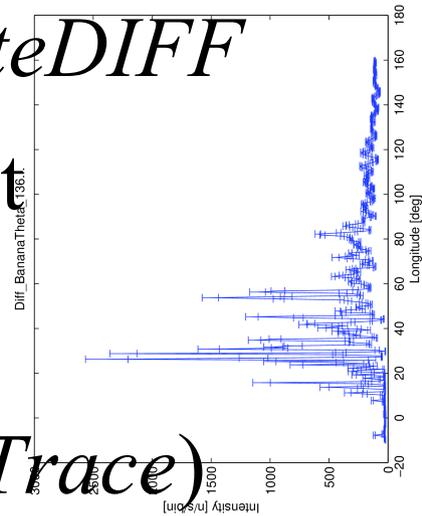

- 1) A powder diffractometer
- 2) A triple axis: simulation and real (cool) stuff
- 3) An advanced simulation of *very slow* neutrons

Example 1: a powder diffractometer

- Crystallography represents about 30% (350/y) of the experiments.
- Allows accurate determination of composition and position of atoms in a material structure.
- Relies on Bragg law: $2d \sin \theta = n\lambda$
- Measures $I(\theta)$ for given $\lambda \rightarrow d \rightarrow$ atoms distances

Example 1: a powder diffractometer

- Install McStas (here deb package)
- Launch McGUI/McStas
- Select *Neutron site* menu/*templates/templateDIFF*
- Click Run, then Start (with 2 cpu), then Plot
- Shows detectors in the simulation, and $I(\theta)$
- Re-run in 3D geometry view (*Simulate* → *Trace*)
- File can be exported in TXT, HDF, Matlab, (ROOT, MCNP/X) ...
- Edit to see code

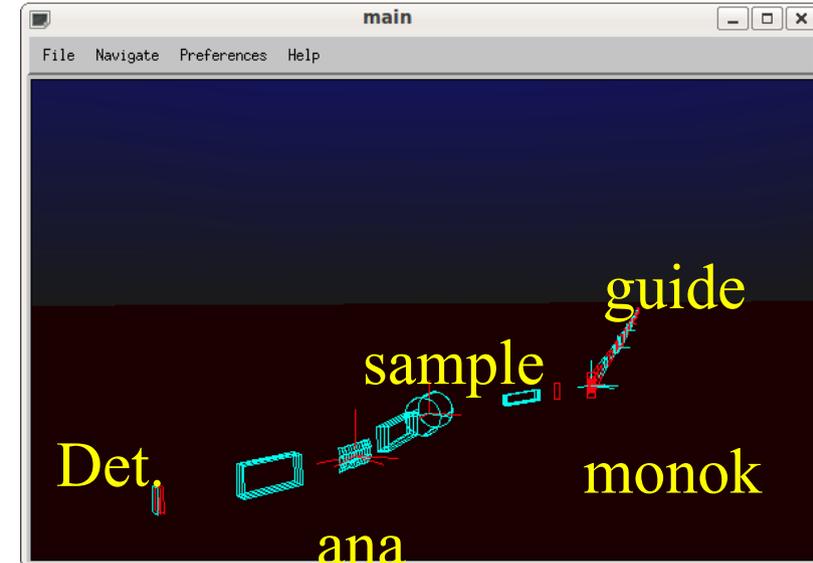

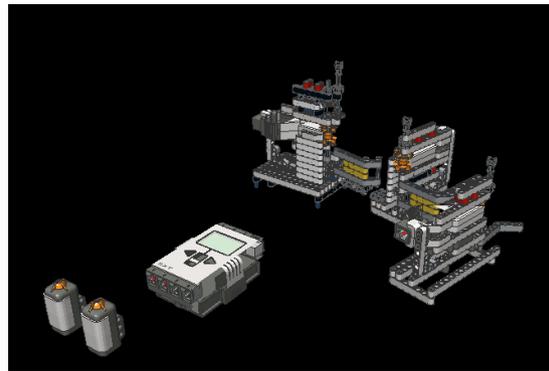

Example 1: a powder diffractometer

- Estimate contribution from sample environment
- Notice it is removed by radial collimator
- Notice that gas detector has 65% efficiency at $\lambda=1 \text{ \AA}$

Example 2: a triple-axis spectrometer

- We here use a modified version of **IN8@ILL**
- Includes an interface with LEGO NXT
- Positions the virtual, LEGO instrument (and real)
- (Real positioning is much slower – big robot)
- Let's try it.

Example 2: TAS + liq-In

Liquid Indium:

- Very low scattering cross section (*good luck !*)
- Very high absorption (*good luck !*)
- Never measured with neutrons (*good luck !*)

Proposal includes both real and virtual experiment:

Simulation showed we would be able to measure the quasi-elastic line
Around the first structure peak in $S(q)$.

Experiment:

Levitation furnace (gas flow+laser)

T=450 K

IN22 $E_i=30.8$ meV

Team: E. Farhi, P. Willendrup, L.P.Regnault, McStas <mcstas.org>

Example 2: TAS + liq-In: real world

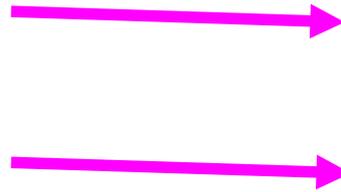

Example 2: TAS + liq-In

Sample simulation

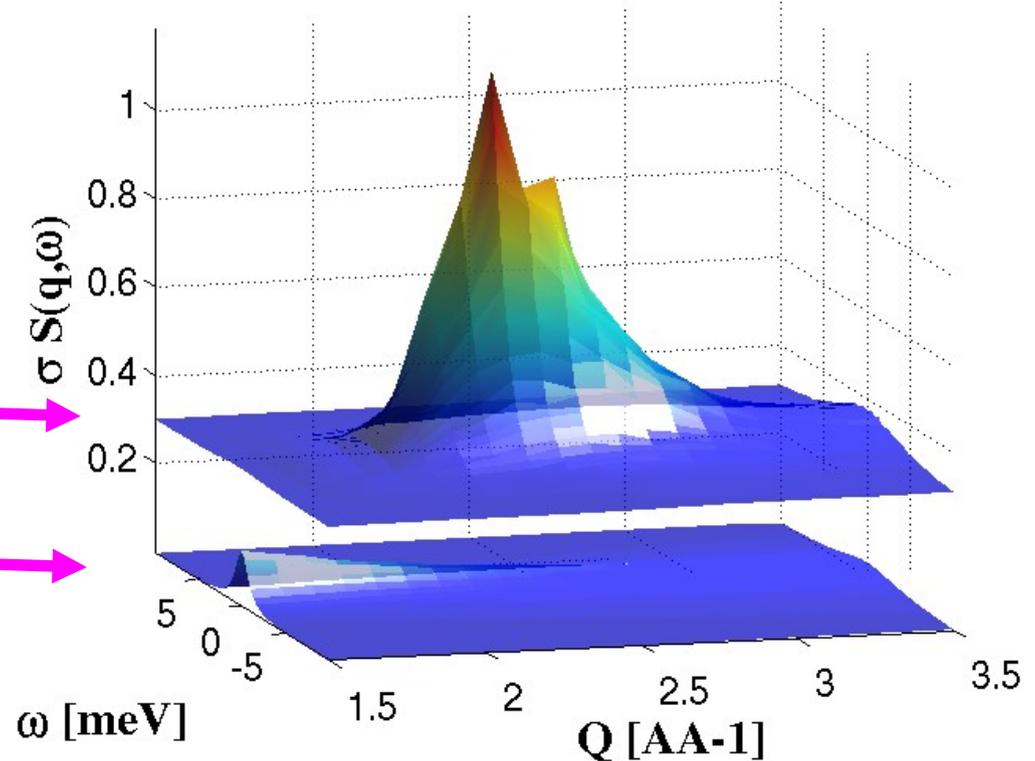

We use *VASP* (*ab-initio MD*)
 200 atoms in a 17 Å cube
 Record atoms dynamics for 36 ps
 Compute $S(q, \omega)$ using *nMoldyn*

Coherent part

Incoherent part

Ab-initio VASP 200 atoms (36 ps)

*We show here the measurement range
 Compared to experiment,
 computed $S(q, \omega)$ is very clean*

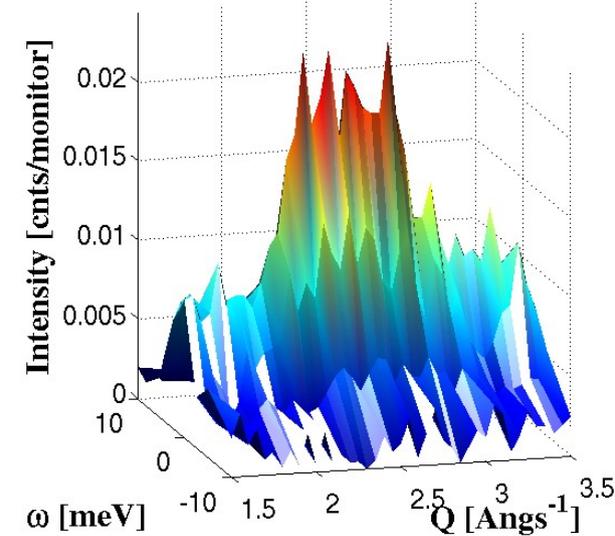

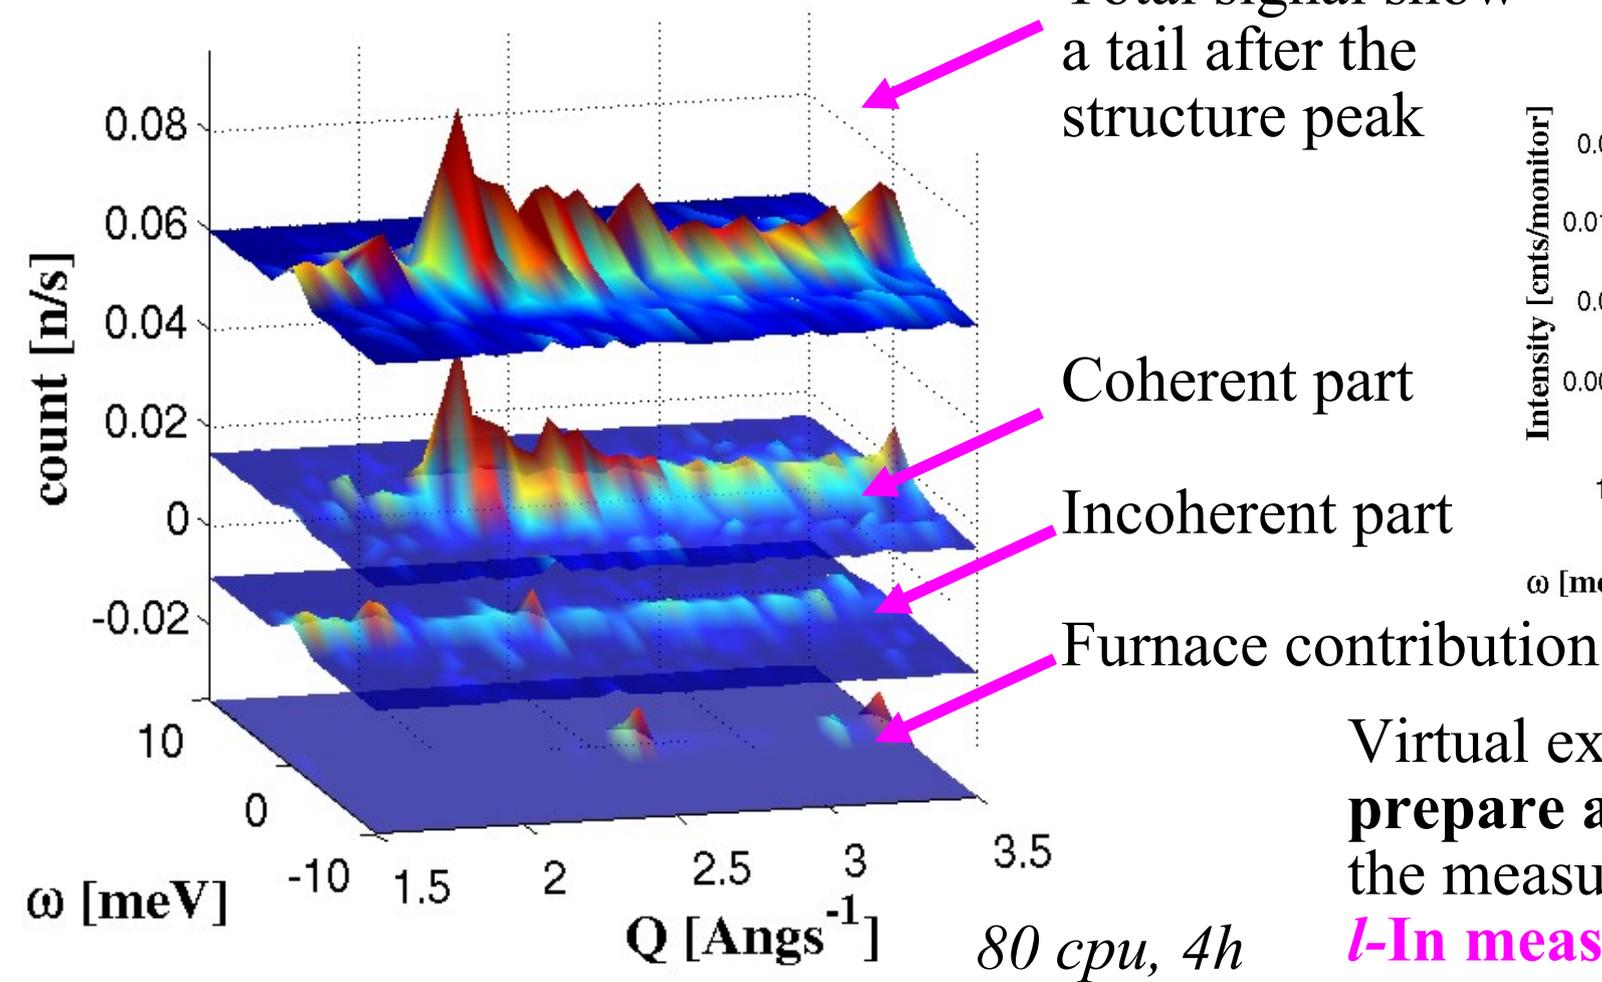

Example 2: *TAS + liq-In*

- Scanning momentum and energy exchange in the sample, we obtain the dynamic structure factor S .

Virtual experiment

Measurement

Measurements on IN22

Virtual experiment enables to **prepare and understand** the measurement.

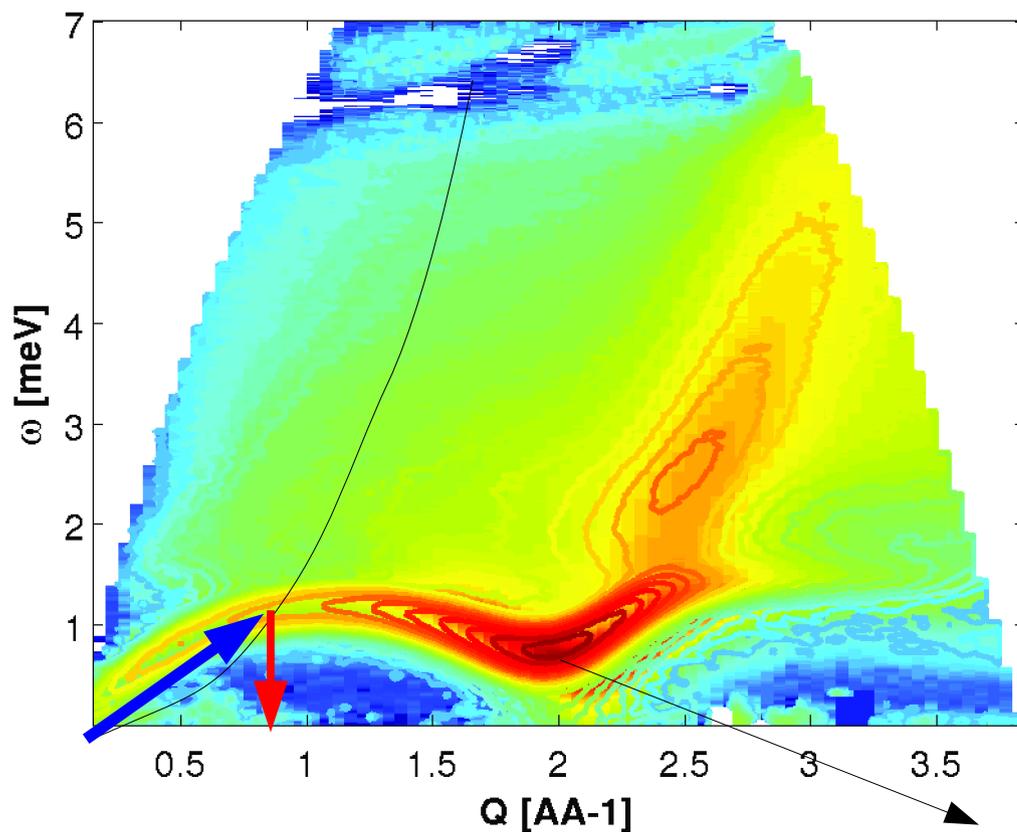

l-In measured with neutron

Example 3: slowing neutrons \rightarrow 250 neV

- Neutrons can give their energy to phonons in ^4He

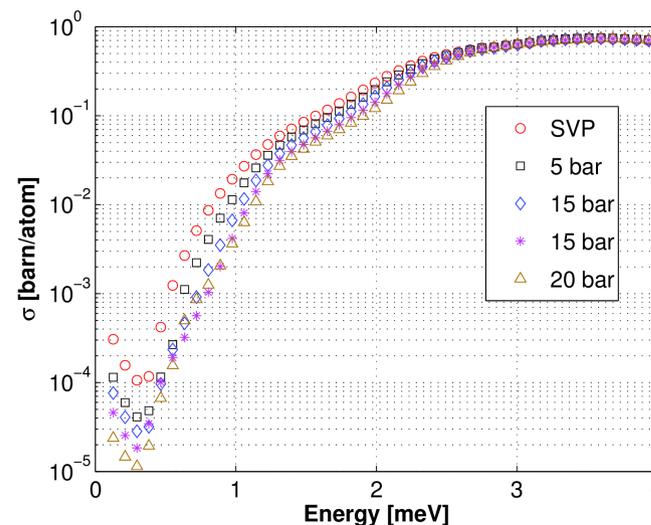

Dynamic structure factor S

^4He : $S(\mathbf{q}, \omega)$ at SVP (contour) and 25 bars (surface)

^4He roton

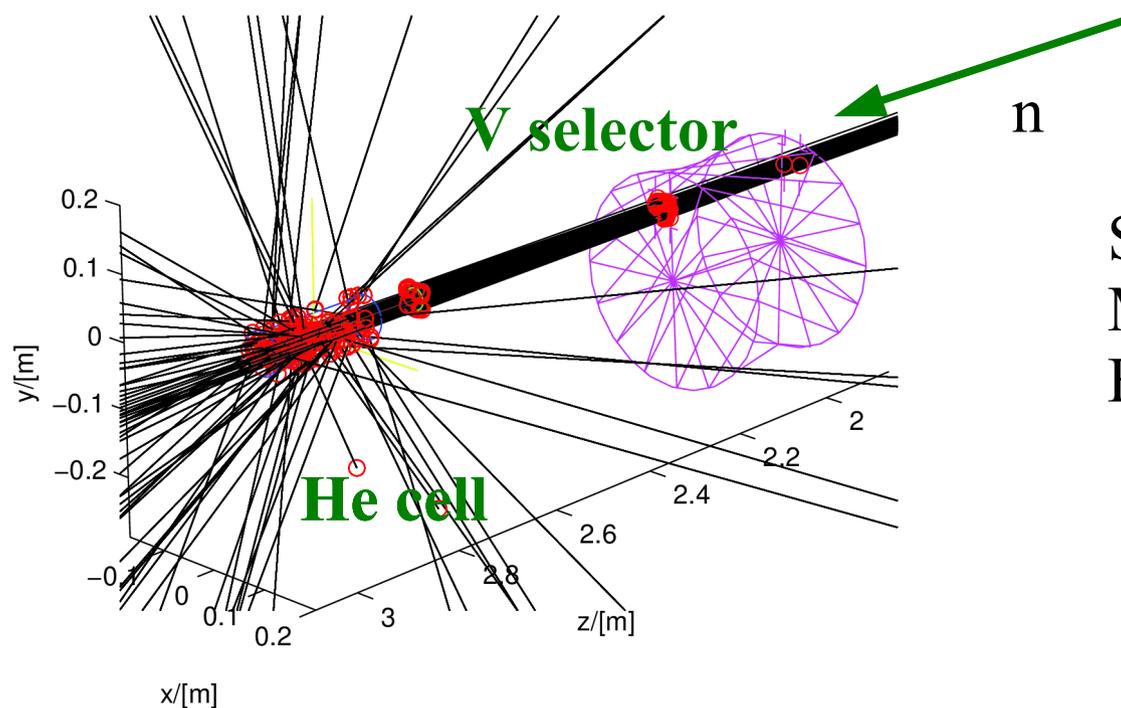

Total cross section

Example 3: slowing neutrons \rightarrow 250 neV

Estimate how efficient the process is for creation of ultra-cold neutrons

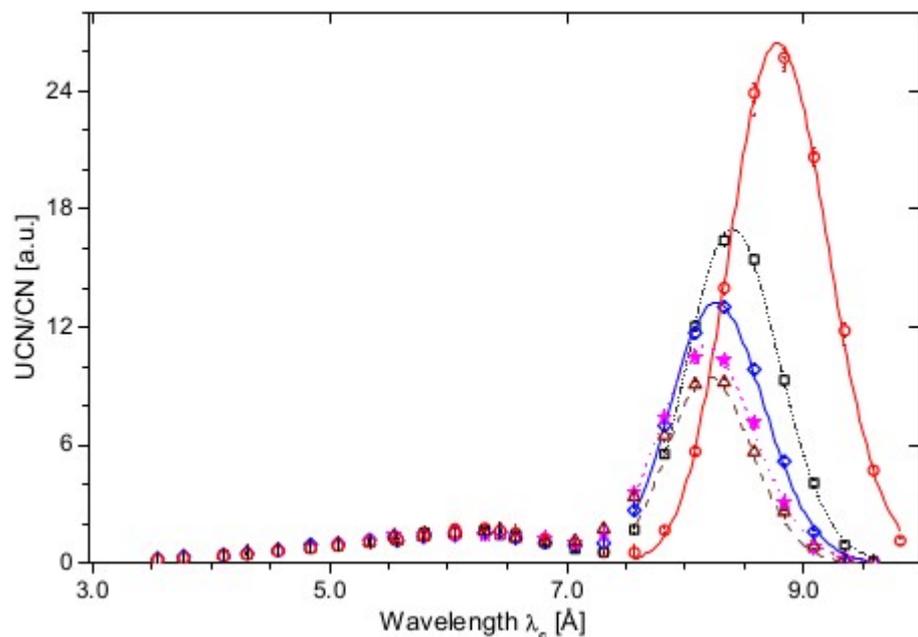

H113 guide@ILL

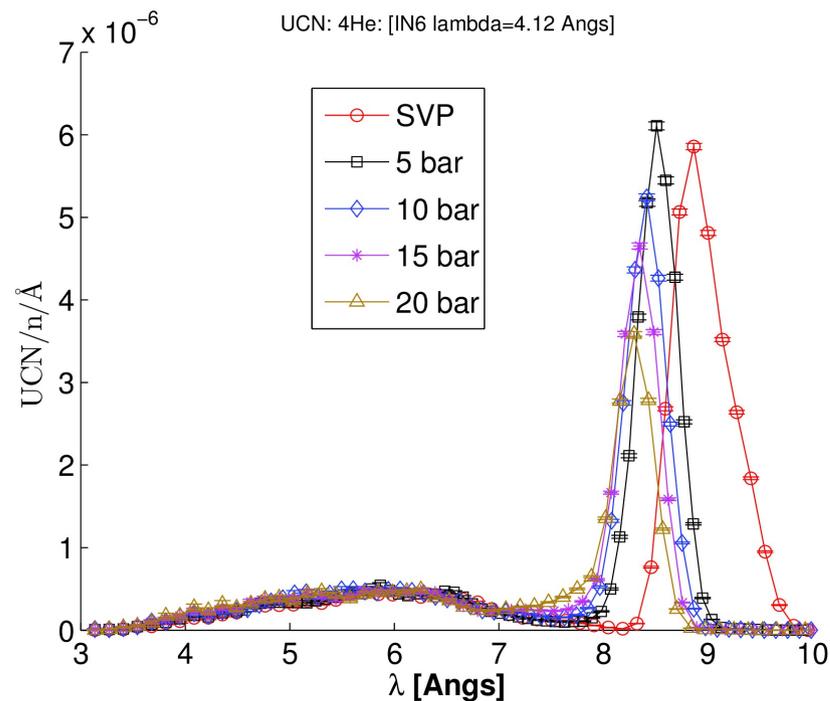

Start with 1-10 meV
Monitor <250 neV
Factor 4M loss

96 cpu, 24h

Example 3: slowing neutrons \rightarrow 250 neV

Measured

Simulated

Estimate how many UCN's can be generated at the ILL: up to **150-200/cm³**
 Current world record **86** (ILL) with a mechanical Doppler turbine.
