Probing the spin and parity of the Higgs Boson with the ATLAS Detector

Tuesday, 17 September 2013 18:10 (40 minutes)

The spin and parity of the recently discovered Higgs boson using the ATLAS detector and up to 25 fb⁻¹ of 7 TeV and 8 TeV pp collision data collected in 2011 and 2012, was probed in the diboson ($\gamma\gamma$, WW and ZZ) channels. These results and their combinations are presented.
