Detector DANSS and the problem of sterile neutrinos

Friday 24 May 2013 11:55 (40 minutes)

Detector DANSS is constructed at the Kalinin Power Plant in Russia to monitor the flux of anti-neutrino from the reactor. Being installed at a small distance from the core it will allow at the same time to measure possible short distant oscillations of anti-neutrino into sterile states. First results with a reduced version of detector were obtained recently.

Presenter: OLSHEVSKIY, Alexander (Joint Inst. for Nuclear Research (RU))
